Momelotinib (Omjjara)

GlaxoSmithKline GmbH & Co. KG

Anhang 4-I zu Modul 4A

Behandlung von krankheitsbedingter Splenomegalie oder Symptomen bei erwachsenen Patienten mit moderater bis schwerer Anämie, die an primärer Myelofibrose, Post-Polycythaemia Vera-Myelofibrose oder Post-Essentieller Thrombozythämie-Myelofibrose erkrankt sind, und die nicht mit einem Januskinase (JAK)-Inhibitor vorbehandelt sind oder die mit Ruxolitinib behandelt wurden

Stand: 31.10.2025

Min, Max	0.72, 56.41	2.92, 53.95	0.72, 6.54	2.92, 6.54
Stratified Log-Rank Test p-value	0.19		0.080	
Adjusted Hazard Ratio (95% CI)	1.42 (0.86, 2.35)		6.04 (0.69, 53.18)	
Unstratified Log-Rank Test p-value	0.15		0.050	
Unadjusted Hazard Ratio (95% CI)	1.43 (0.87, 2.34)		6.54 (0.76, 56.36)	

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
Death in the DB phase is death occurring on or after the 1st DB dose up to the earliest of the last DB dose + 30 days, or the 1st OL dose -1 day.
Death in the OL phase is death occurring on or after 1st OL dose up to the last OL MMB dose + 30 days.
Death in the follow-up phase is death occurring after 30 days of the last dose in DB or OL phase, whichever the latest.
Stratified two-sided p-value is from a log-rank test comparing treatment stratified by baseline TD (yes,no) and baseline platelet count (<100,100-200,>200 10^9/L). Adjusted hazard ratio and 95% CI are from a Cox proportional hazards model with covariates of treatment, baseline TD (yes,no) and baseline platelet count (<100,100-200,>200 10^9/L). Unstratified two-sided p-value is from a log-rank test comparing treatment.
Unadjusted hazard ratio and 95% CI are from a Cox proportional hazards model with a covariate of treatment. NE = Not estimable.

	MMB (N=86)	RUX (N=94)	
Percent Change in Spleen Volume (cm^3) at Week 24 from Baseline			
n	70	86	
Mean (SD)	-28.6 (21.74)	-23.6 (20.05)	
Median	-29.2	-22.5	
Q1, Q3	-43.9, -14.8	-40.3, -9.4	
Min, Max	-67.7, 26.2	-64.2, 32.2	
Difference in Percent Change from Baseline at Week 24			
n [1]	76	91	
n [2]	70	86	
MMRM: Least Squares Mean [SE] (95% CI)	-25.55 [2.55] (-30.60, -20.51)		-21.81 [2.40] (-26.55, -17.06)
MMRM: Least Squares Mean Difference [SE] (95% CI)	-3.75 [3.26] (-10.18, 2.68)		
MMRM: P-value	0.25		
Corrected Hedges' g (95% CI)	-0.171 (-0.487, 0.146)		
Stratified Wilcoxon Rank Sum (van Elteren) p-value	0.090		

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
MMRM model included Treatment, Baseline value, Baseline TD (yes, no) and Baseline platelet count (<100, 100-200, >200 10^9/L), Visit and Treatment by Visit interaction as covariates.
[1] Number of subjects with analysable data for one or more time points.
[2] Number of subjects with analysable data at the current time point.

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
For Switch (RUX->MMB) group, the baseline is the last assessment prior to or on the date of the 1st MMB dose in the OL phase.
For Continuing (MMB->MMB), the baseline is the last assessment prior to or on the date of randomization.

P-value for interaction test				

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
Stratified two-sided p-value is from a log-rank test comparing treatment stratified by baseline TD (yes,no) and baseline platelet count (<100,100-200,>200 10^9/L). Adjusted hazard ratio and 95% CI are from a Cox proportional hazards model with covariates of treatment, baseline TD (yes,no) and baseline platelet count (<100,100-200,>200 10^9/L). Unstratified two-sided p-value is from a log-rank test comparing treatment. Unadjusted hazard ratio and 95% CI are from a Cox proportional hazards model with a covariate of treatment.
P-value for interaction test is from a Cox proportional hazards model with covariates of treatment, subgroup, baseline TD (yes,no), baseline platelet count (<100,100-200,>200 10^9/L) and treatment by subgroup interaction.
MRI = Magnetic Resonance Imaging. CT = Computerized Tomography.

	Continuing (MMB->MMB) (N=64)	Switch (RUX->MMB) (N=84)	Total (N=148)	MMB in DB (N=86)	Total (N=170)
Week 144 in Open-label Phase					
Subjects ongoing and not reaching Week 144 in Open-label Phase	0	0	0		
Subjects Evaluable for Splenic Response Rate at Week 144 in Open-label Phase	64 (100.0%)	84 (100.0%)	148 (100.0%)		
Splenic Response Rate at Week 144 in Open-label Phase					
Responder, n(%)	6 (9.4%)	0	6 (4.1%)		
95% Exact CI	0.0352, 0.1930	0.0000, 0.0430	0.0150, 0.0861		
Non-Responder, n(%)	58 (90.6%)	84 (100.0%)	142 (95.9%)		
Baseline Spleen Volume not available	0	0	0		
Spleen Volume at Week 144 not available	54 (84.4%)	75 (89.3%)	129 (87.2%)		
>0% Spleen Volume increase at Week 144	0	7 (8.3%)	7 (4.7%)		
<35% Spleen Volume reduction from Baseline	4 (6.3%)	9 (10.7%)	13 (8.8%)		
Discontinuation early at Week 144	50 (78.1%)	70 (83.3%)	120 (81.1%)		

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
95% Exact CI is based on Clopper-Pearson method without stratification.
For Switch (RUX->MMB) group, the baseline is the last assessment prior to or on the date of the 1st MMB dose in the OL phase.
For Continuing (MMB->MMB), the baseline is the last assessment prior to or on the date of randomization.
Number of subjects evaluable for analysis at a visit = Number of subjects in the analysis set - number of subjects ongoing and did not reach the visit.
Denominator of response rate calculation is the number of subjects evaluable for analysis at a visit.

Data Extracted: CRF data: 01JUL2019

Non-missing	42 (48.8%)	52 (55.3%)	94 (52.2%)
Missing	27 (31.4%)	26 (27.7%)	53 (29.4%)

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.

[1] p-values were obtained from a Z-test.

[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model with robust sandwich matrix estimators, including treatment, baseline TD (yes, no), and baseline platelet count (<100, 100-200, >200 10^9/L) as covariates.

Modified Poisson regression model did not converge so these values are presented as NE. NE = Not Estimable.

Table 2.0801: Analysis of TSS, Change and % Change from Baseline by Every 4 weeks
Double-Blind Phase
ITT-Anemic Analysis Set

	MMB (N=86)	RUX (N=94)	
Change in Average Daily Total Symptom Score at Week 24 from Baseline			
n	66	79	
Mean (SD)	-4.7 (8.82)	-6.5 (8.10)	
Median	-3.3	-4.5	
Q1, Q3	-10.0, 0.6	-10.8, -1.1	
Min, Max	-39.5, 15.0	-27.6, 11.5	
Difference in Change from Baseline at Week 24			
n [1]	80	93	
n [2]	66	79	
MMRM: Least Squares Mean [SE] (95% CI)	-4.37 [0.95] (-6.24, -2.49)		-6.44 [0.87] (-8.16, -4.72)
MMRM: Least Squares Mean Difference [SE] (95% CI)	2.07 [1.24] (-0.39, 4.52)		
MMRM: P-value	0.098		
Corrected Hedges' g (95% CI)	0.266 (-0.062, 0.594)		
Stratified Wilcoxon Rank Sum (van Elteren) p-value	0.46		
Percent Change in Average Daily Total Symptom Score at Week 24 from Baseline			
n	64	79	
Mean (SD)	33.8 (434.68)	-33.2 (50.83)	
Median	-29.3	-40.1	
Q1, Q3	-61.9, 5.1	-70.6, -8.9	
Min, Max	-100.0, 3400.0	-100.0, 246.2	

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
MMRM model included Treatment, Baseline value, Baseline TD (yes, no) and Baseline platelet count (<100, 100-200, >200 10^9/L), Visit and Treatment by Visit interaction as covariates.
[1] Number of subjects with analysable data for one or more time points.

Table 2.0736: Analysis of Response Rate (improvement, 50% criterion) in TSS Item Score (Inactivity) by Every 4 Weeks

Double-Blind Phase

ITT-Anemic Analysis Set

	MMB (N=86)	RUX (N=94)	Total (N=180)
Inactivity Symptom Score Status			
Missing Inactivity Score at baseline (excluded from rate calculation)	1 (1.2%)	1 (1.1%)	2 (1.1%)
Inactivity Score = 0 at baseline	8 (9.3%)	11 (11.7%)	19 (10.6%)
Inactivity Score > 0 at baseline	77 (89.5%)	82 (87.2%)	159 (88.3%)
Response Rate of Inactivity Symptom Score at Week 4			
Subjects Evaluable at Week 4, n	84	85	169
Inactivity Score = 0 at baseline and Inactivity Score >0 or missing at Week 4	7 (8.3%)	3 (3.5%)	10 (5.9%)
Responder, n(%)	7 (8.3%)	16 (18.8%)	23 (13.6%)
95% Exact CI	0.0342, 0.1642	0.1116, 0.2876	0.0883, 0.1972
Proportion Difference - Stratified CMH Method (95% CI)		-0.11 (-0.23, 0.00)	
p-value	0.049		
Proportion Difference - Unstratified CMH Method (95% CI)		-0.10 (-0.21, 0.00)	
p-value	0.048		
Proportion Difference - Unstratified Exact Method (95% CI)		-0.10 (-0.25, 0.04)	
p-value	0.071		
Unadjusted Inverse Relative Risk (95% CI)		2.26 (0.98, 5.21)	
p-value [1]	0.056		
Unadjusted Inverse Odds Ratio (95% CI)		2.55 (0.99, 6.57)	
p-value [1]	0.052		
Unadjusted Absolute Risk Difference (95% CI)		-0.10 (-0.21, 0.00)	
Adjusted Inverse Relative Risk (95% CI) [2]		2.42 (1.03, 5.68)	
p-value [2]	0.043		

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.

95% Exact CI is based on Clopper-Pearson method without stratification. TSS = Total Symptom Score, CMH = Cochran-Mantel-Haenszel.

Response rate analysis at each visit only includes subjects with item score > 0 at baseline or (score = 0 at baseline and [score > 0 or missing]).

Subjects with item score = 0 at baseline and = 0 at the visit are excluded from response rate analysis but are included in return rate calculations.

[1] p-values were obtained from a Z-test.

[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model with robust sandwich matrix estimators, including treatment, baseline TD (yes, no), and baseline platelet count (<100, 100-200, >200 10^9/L) as covariates.

Adjusted Inverse Relative Risk (95% CI) [2]	1.20 (0.79, 1.80)		
p-value [2]	0.39		

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.

95% Exact CI is based on Clopper-Pearson method without stratification. TSS = Total Symptom Score, CMH = Cochran-Mantel-Haenszel.

Response rate analysis at each visit only includes subjects with item score > 0 at baseline or (score = 0 at baseline and [score > 0 or missing]).

Subjects with item score = 0 at baseline and = 0 at the visit are excluded from response rate analysis but are included in return rate calculations.

[1] p-values were obtained from a Z-test.

[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model with robust sandwich matrix estimators, including treatment, baseline TD (yes, no), and baseline platelet count (<100, 100-200, >200 10^9/L) as covariates.

Modified Poisson regression model did not converge so these values are presented as NE. NE = Not Estimable.

Adjusted Inverse Relative Risk (95% CI) [2]	1.09 (0.69, 1.72)		
p-value [2]	0.70		

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
95% Exact CI is based on Clopper-Pearson method without stratification. TSS = Total Symptom Score, CMH = Cochran-Mantel-Haenszel.
Response rate analysis at each visit only includes subjects with item score > 0 at baseline or (score = 0 at baseline and [score > 0 or missing]).
Subjects with item score = 0 at baseline and = 0 at the visit are excluded from response rate analysis but are included in return rate calculations.
[1] p-values were obtained from a Z-test.
[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model with robust sandwich matrix estimators, including treatment, baseline TD (yes, no), and baseline platelet count (<100, 100-200, >200 10^9/L) as covariates.

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
RBC transfusion independent response is defined as the absence of RBC transfusions and no hemoglobin level below 8 g/dL in the prior 12 weeks.
Stratified two-sided p-value is from a log-rank test comparing treatment stratified by baseline TD (yes,no) and baseline platelet count (<100,100-200,>200 10^9/L). Adjusted hazard ratio and 95% CI are from a Cox proportional hazards model with covariates of treatment, baseline TD (yes,no) and baseline platelet count (<100,100-200,>200 10^9/L). Unstratified two-sided p-value is from a log-rank test comparing treatment. Unadjusted hazard ratio and 95% CI are from a Cox proportional hazards model with a covariate of treatment.
P-value for interaction test is from a Cox proportional hazards model with covariates of treatment, subgroup, baseline TD (yes,no), baseline platelet count (<100,100-200,>200 10^9/L) and treatment by subgroup interaction. NE = Not estimable.

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
RBC transfusion independent response is defined as the absence of RBC transfusions and no hemoglobin level below 8 g/dL in the prior 12 weeks.
Stratified two-sided p-value is from a log-rank test comparing treatment stratified by baseline TD (yes,no) and baseline platelet count (<100,100-200,>200 10^9/L). Adjusted hazard ratio and 95% CI are from a Cox proportional hazards model with covariates of treatment, baseline TD (yes,no) and baseline platelet count (<100,100-200,>200 10^9/L). Unstratified two-sided p-value is from a log-rank test comparing treatment. Unadjusted hazard ratio and 95% CI are from a Cox proportional hazards model with a covariate of treatment.
P-value for interaction test is from a Cox proportional hazards model with covariates of treatment, subgroup, baseline TD (yes,no), baseline platelet count (<100,100-200,>200 10^9/L) and treatment by subgroup interaction. NE = Not estimable.

Unadjusted Inverse Odds Ratio (95% CI)	0.41 (0.22, 0.75)		
p-value [1]	0.004		
Unadjusted Absolute Risk Difference (95% CI)	0.22 (0.07, 0.36)		
Adjusted Inverse Relative Risk (95% CI) [2]	0.55 (0.40, 0.77)		
p-value [2]	<0.001		
Non-Responder, n(%)	39 (45.3%)	63 (67.0%)	102 (56.7%)

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
95% Exact CI is based on Clopper-Pearson method without stratification.
CMH = Cochran-Mantel-Haenszel.
RBC = Red Blood Cell.
[1] p-values were obtained from a Z-test.
[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model with robust sandwich matrix estimators, including treatment, baseline TD (yes, no), and baseline platelet count (<100, 100-200, >200 10^9/L) as covariates.

Discontinued prior to week 24	0	0	6 (16.7%)	1 (2.6%)	

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
Modified Poisson regression model did not converge so these values are presented as NE. NE = Not Estimable.
[1] p-values were obtained from a Z-test.
[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model, including treatment, baseline TD (yes, no), and baseline platelet count (<100, 100-200, >200 10^9/L) as covariates.
[3] The interaction test p-value was obtained for the treatment by subgroup interaction term from the corresponding modified Poisson regression which additionally includes subgroup as covariate and the treatment by subgroup interaction term.

Data Extracted: CRF data: 01JUL2019

Median (95% CI)	12.71 (12.14, 16.57)	12.14 (12.14, 20.00)
75-percentile (95% CI)	22.00 (13.14, 23.43)	20.00 (12.14, NE)
Min, Max	12.14, 24.14	12.14, 22.57
Stratified Log-Rank Test p-value	0.37	
Adjusted Inverse Hazard Ratio (95% CI)	1.61 (0.74, 3.49)	
Unstratified Log-Rank Test p-value	0.32	
Unadjusted Inverse Hazard Ratio (95% CI)	1.44 (0.69, 3.01)	

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
RBC transfusion independent response is defined as the absence of RBC transfusions and no hemoglobin level below 8 g/dL in the prior 12 weeks.
Stratified two-sided p-value is from a log-rank test comparing treatment stratified by baseline TD (yes,no) and baseline platelet count
Adjusted hazard ratio and 95% CI are from a Cox proportional hazards model with covariates of treatment, baseline TD (yes,no) and baseline platelet count (<100,100-200,>200 10^9/L). Unstratified two-sided p-value is from a log-rank test comparing treatment.
Unadjusted hazard ratio nd 95% CI are from a Cox proportional hazards model with a covariate of treatment. NE = Not estimable.

Discontinued prior to week 12	10 (11.6%)	0	10 (5.6%)

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.

[1] p-values were obtained from a Z-test.

[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model with robust sandwich matrix estimators, including treatment, baseline TD (yes,no), and baseline platelet count (<100,100-200,>200 10^9/L) as covariates.

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.

For MMB and RUX group, the baseline is based on the RBC transfusion within 84 days prior to or on the date of randomization, excluding RBC transfusion associated with clinically overt bleeding. RBC = Red Blood Cell.

[1] p-values were obtained from a Z-test.

[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model with robust sandwich matrix estimators, including treatment, baseline TD (yes, no), and baseline platelet count (<100, 100-200, >200 10^9/L) as covariates.

P-value for interaction test			NA

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
Any type transfusion free response is defined as the absence of transfusions of any type in the prior 12 weeks.
Stratified two-sided p-value is from a log-rank test comparing treatment stratified by baseline TD (yes,no) and baseline platelet count (<100,100-200,>200 10^9/L). Adjusted hazard ratio and 95% CI are from a Cox proportional hazards model with covariates of treatment, baseline TD (yes,no) and baseline platelet count (<100,100-200,>200 10^9/L). Unstratified two-sided p-value is from a log-rank test comparing treatment. Unadjusted hazard ratio and 95% CI are from a Cox proportional hazards model with a covariate of treatment.
P-value for interaction test is from a Cox proportional hazards model with covariates of treatment, subgroup, baseline TD (yes,no), baseline platelet count (<100,100-200,>200 10^9/L) and treatment by subgroup interaction. NE = Not estimable.

P-value for interaction test				

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
RBC transfusion free response is defined as the absence of RBC transfusions in the prior 12 weeks.
Stratified two-sided p-value is from a log-rank test comparing treatment stratified by baseline TD (yes,no) and baseline platelet count (<100,100-200,>200 10^9/L). Adjusted hazard ratio and 95% CI are from a Cox proportional hazards model with covariates of treatment, baseline TD (yes,no) and baseline platelet count (<100,100-200,>200 10^9/L). Unstratified two-sided p-value is from a log-rank test comparing treatment. Unadjusted hazard ratio and 95% CI are from a Cox proportional hazards model with a covariate of treatment.
P-value for interaction test is from a Cox proportional hazards model with covariates of treatment, subgroup, baseline TD (yes,no), baseline platelet count (<100,100-200,>200 10^9/L) and treatment by subgroup interaction. NE = Not estimable.

RBC Transfusion within 12 weeks prior to Week 24	26 (30.2%)	55 (58.5%)	81 (45.0%)
Discontinued prior to week 24	16 (18.6%)	8 (8.5%)	24 (13.3%)

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
For MMB and RUX group, the baseline is based on the RBC transfusion within 84 days prior to or on the date of randomization, excluding RBC transfusion associated with clinically overt bleeding. RBC = Red Blood Cell.
[1] p-values were obtained from a Z-test.
[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model with robust sandwich matrix estimators, including treatment, baseline TD (yes, no), and baseline platelet count (<100, 100-200, >200 10^9/L) as covariates.

Discontinued prior to week 12	10 (11.6%)	2 (2.1%)	12 (6.7%)

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
For MMB and RUX group, the baseline is based on the RBC transfusion within 84 days prior to or on the date of randomization, excluding RBC transfusion associated with clinically overt bleeding. RBC = Red Blood Cell.
[1] p-values were obtained from a Z-test.
[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model with robust sandwich matrix estimators, including treatment, baseline TD (yes, no), and baseline platelet count (<100, 100-200, >200 10^9/L) as covariates.

p-value [2]	0.82		NE		

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
[1] p-values were obtained from a Z-test.
[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model, including treatment, baseline TD (yes,no), and baseline platelet count (<100,100-200,>200 10^9/L) as covariates.
[3] The interaction test p-value was obtained for the treatment by subgroup interaction term from the corresponding modified Poisson regression which additionally includes subgroup as covariate and the treatment by subgroup interaction term.
Modified Poisson regression model did not converge so these values are presented as NE. NE = Not estimable.

[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model, including treatment, baseline TD (yes,no), and baseline platelet count (<100,100-200,>200 10^9/L) as covariates.
[3] The interaction test p-value was obtained for the treatment by subgroup interaction term from the corresponding modified Poisson regression which additionally includes subgroup as covariate and the treatment by subgroup interaction term.
Modified Poisson regression model did not converge so these values are presented as NE. NE = Not estimable.

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
For MMB and RUX group, the baseline is based on the RBC transfusion within 84 days prior to or on the date of randomization, excluding RBC transfusion associated with clinically overt bleeding. RBC = Red Blood Cell.
[1] p-values were obtained from a Z-test.
[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model, including treatment, baseline TD (yes, no), and baseline platelet count (<100, 100-200, >200 10^9/L) as covariates.
[3] The interaction test p-value was obtained for the treatment by subgroup interaction term from the corresponding modified Poisson regression which additionally includes subgroup as covariate and the treatment by subgroup interaction term.

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
For MMB and RUX group, the baseline is based on the RBC transfusion within 84 days prior to or on the date of randomization, excluding RBC transfusion associated with clinically overt bleeding. RBC = Red Blood Cell.
[1] p-values were obtained from a Z-test.
[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model, including treatment, baseline TD (yes, no), and baseline platelet count (<100, 100-200, >200 10^9/L) as covariates.
[3] The interaction test p-value was obtained for the treatment by subgroup interaction term from the corresponding modified Poisson regression which additionally includes subgroup as covariate and the treatment by subgroup interaction term.

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
For MMB and RUX group, the baseline is based on the RBC transfusion within 84 days prior to or on the date of randomization, excluding RBC transfusion associated with clinically overt bleeding. RBC = Red Blood Cell.
Modified Poisson regression model did not converge so these values are presented as NE. NE = Not Estimable.
[1] p-values were obtained from a Z-test. [2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model, including treatment, baseline TD (yes, no), and baseline platelet count (<100, 100-200, >200 10^9/L) as covariates.
[3] The interaction test p-value was obtained for the treatment by subgroup interaction term from the corresponding modified Poisson regression which additionally includes subgroup as covariate and the treatment by subgroup interaction term.

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
For MMB and RUX group, the baseline is based on the RBC transfusion within 84 days prior to or on the date of randomization, excluding RBC transfusion associated with clinically overt bleeding. RBC = Red Blood Cell.
[1] p-values were obtained from a Z-test.
[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model, including treatment, baseline TD (yes, no), and baseline platelet count (<100, 100-200, >200 10^9/L) as covariates.
[3] The interaction test p-value was obtained for the treatment by subgroup interaction term from the corresponding modified Poisson regression which additionally includes subgroup as covariate and the treatment by subgroup interaction term.

P-value for interaction test					0.34

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
Any type transfusion free response is defined as the absence of transfusions of any type in the prior 12 weeks.
Stratified two-sided p-value is from a log-rank test comparing treatment stratified by baseline TD (yes,no) and baseline platelet count (<100,100-200,>200 10^9/L). Adjusted hazard ratio and 95% CI are from a Cox proportional hazards model with covariates of treatment, baseline TD (yes,no) and baseline platelet count (<100,100-200,>200 10^9/L). Unstratified two-sided p-value is from a log-rank test comparing treatment. Unadjusted hazard ratio and 95% CI are from a Cox proportional hazards model with a covariate of treatment.
P-value for interaction test is from a Cox proportional hazards model with covariates of treatment, subgroup, baseline TD (yes,no), baseline platelet count (<100,100-200,>200 10^9/L) and treatment by subgroup interaction. NE = Not estimable.

Stratified two-sided p-value is from a log-rank test comparing treatment stratified by baseline TD (yes,no) and baseline platelet count (<100,100-200,>200 10^9/L). Adjusted hazard ratio and 95% CI are from a Cox proportional hazards model with covariates of treatment, baseline TD (yes,no) and baseline platelet count (<100,100-200,>200 10^9/L). Unstratified two-sided p-value is from a log-rank test comparing treatment. Unadjusted hazard ratio and 95% CI are from a Cox proportional hazards model with a covariate of treatment.
P-value for interaction test is from a Cox proportional hazards model with covariates of treatment, subgroup, baseline TD (yes,no), baseline platelet count (<100,100-200,>200 10^9/L) and treatment by subgroup interaction. NE = Not estimable.

P-value for interaction test				

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
RBC transfusion free response is defined as the absence of RBC transfusions in the prior 12 weeks.
Stratified two-sided p-value is from a log-rank test comparing treatment stratified by baseline TD (yes,no) and baseline platelet count (<100,100-200,>200 10^9/L). Adjusted hazard ratio and 95% CI are from a Cox proportional hazards model with covariates of treatment, baseline TD (yes,no) and baseline platelet count (<100,100-200,>200 10^9/L). Unstratified two-sided p-value is from a log-rank test comparing treatment. Unadjusted hazard ratio and 95% CI are from a Cox proportional hazards model with a covariate of treatment. P-value for interaction test is from a Cox proportional hazards model with covariates of treatment, subgroup, baseline TD (yes,no), baseline platelet count (<100,100-200,>200 10^9/L) and treatment by subgroup interaction. NE = Not estimable.

Unadjusted Absolute Risk Difference (95% CI)	-0.18 (-0.31, -0.05)		
Adjusted Relative Risk (95% CI) [2]	0.73 (0.60, 0.88)		
p-value [2]	0.001		

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
95% Exact CI is based on Clopper-Pearson method without stratification.
CMH = Cochran-Mantel-Haenszel.
RBC = Red Blood Cell.
[1] p-values were obtained from a Z-test.
[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model with robust sandwich matrix estimators, including treatment, baseline TD (yes, no), and baseline platelet count (<100, 100-200, >200 10^9/L) as covariates.

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
Stratified two-sided p-value is from a log-rank test comparing treatment stratified by baseline TD (yes,no) and baseline platelet count (<100,100-200,>200 10^9/L).

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
Proportional means model is Andersen-Gill model with robust sandwich variance estimate.
[1] The interaction test p-value was obtained for the treatment by subgroup interaction term from the corresponding Negative Binomial regression which additionally includes subgroup as covariate and the treatment by subgroup interaction term.
RBC = Red Blood Cell.

P-value for interaction test				

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
Stratified two-sided p-value is from a log-rank test comparing treatment stratified by baseline TD (yes,no) and baseline platelet count (<100,100-200,>200 10^9/L). Adjusted hazard ratio and 95% CI are from a Cox proportional hazards model with covariates of treatment, baseline TD (yes,no) and baseline platelet count (<100,100-200,>200 10^9/L). Unstratified two-sided p-value is from a log-rank test comparing treatment.
Unadjusted hazard ratio and 95% CI are from a Cox proportional hazards model with a covariate of treatment.
P-value for interaction test is from a Cox proportional hazards model with covariates of treatment, subgroup, baseline TD (yes,no), baseline platelet count (<100,100-200,>200 10^9/L) and treatment by subgroup interaction. NE = Not estimable.

Peripheral Neuropathy SMQ (Narrow Term Only) -> Study Drug Disc	3 (4.7%)	3 (3.6%)	6 (4.1%)	6 (3.5%)
Non-Hematological	58 (90.6%)	81 (96.4%)	139 (93.9%)	163 (95.9%)
Cataract	6 (9.4%)	3 (3.6%)	9 (6.1%)	11 (6.5%)
First Dose Effect	-	1 (1.2%)	-	6 (3.5%)
Serious TEAEs for First Dose Effect	-	0	-	1 (0.6%)

SAF-Anemic Analysis includes subjects in the Safety Population with Baseline Hemoglobin < 10 g/dL.
Adverse events were mapped according to MedDRA Version 22.0
Severity grades were defined by The CTCAE Version 4.03
Related to study drug under OL phase is defined as related to OL MMB.
TEAE = Treatment-Emergent Adverse Event

SAF-Anemic Analysis includes subjects in the Safety Population with Baseline Hemoglobin < 10 g/dL.
Adverse events were mapped according to MedDRA Version 22.0
Multiple AEs were counted only once per subject for each SOC and PT.
SOCs, PTs (within each SOC) were presented by descending order of frequency under the last column.
TEAE = Treatment-Emergent Adverse Event; SOC = System Organ Class; PT = Preferred Term

Data Extracted: CRF data: 01JUL2019

Musculoskeletal and connective tissue disorders	16 (25.0%)	30 (35.7%)	46 (31.1%)	61 (35.9%)
Pain in extremity	7 (10.9%)	6 (7.1%)	13 (8.8%)	21 (12.4%)
Back pain	4 (6.3%)	11 (13.1%)	15 (10.1%)	20 (11.8%)

SAF-Anemic Analysis includes subjects in the Safety Population with Baseline Hemoglobin < 10 g/dL.
Adverse events were mapped according to MedDRA Version 22.0
Multiple AEs were counted only once per subject for each SOC and PT.
SOCs, PTs (within each SOC) were presented by descending order of frequency under the last column.
TEAE = Treatment-Emergent Adverse Event; SOC = System Organ Class; PT = Preferred Term

Data Extracted: CRF data: 01JUL2019

Conjunctival haemorrhage	3 (4.7%)	1 (1.2%)	4 (2.7%)	4 (2.4%)

SAF-Anemic Analysis includes subjects in the Safety Population with Baseline Hemoglobin < 10 g/dL.
Adverse events were mapped according to MedDRA Version 22.0
Multiple AEs were counted only once per subject for each SOC and PT.
SOCs, PTs (within each SOC) were presented by descending order of frequency under the last column.
TEAE = Treatment-Emergent Adverse Event; SOC = System Organ Class; PT = Preferred Term

SAF-Anemic Analysis includes subjects in the Safety Population with Baseline Hemoglobin < 10 g/dL.
TEAE = Treatment-Emergent Adverse Event; SOC = System Organ Class; PT = Preferred Term. Adverse events were mapped according to MedDRA Version 22.0.
Severity grades were defined by CTCAE Version 4.03.
Multiple AEs were counted only once per subject for each SOC and PT.
SOCs, and then PTs within a SOC were presented by descending order of the frequencies under "MMB" column.
[1] p-values were obtained from a Z-test.

p-value [1]	0.95						
Unadjusted Absolute Risk Difference (95% CI)	0.00 (-0.03, 0.03)						

SAF-Anemic Analysis includes subjects in the Safety Population with Baseline Hemoglobin < 10 g/dL.
TEAE = Treatment-Emergent Adverse Event; SOC = System Organ Class; PT = Preferred Term. Adverse events were mapped according to MedDRA Version 22.0.
Multiple AEs were counted only once per subject for each SOC and PT.
SOCs, and then PTs within a SOC were presented by descending order of the frequencies under "MMB" column.
[1] p-values were obtained from a Z-test.

Grade 4	0	0	0	1 (0.6%)

SAF-Anemic Analysis includes subjects in the Safety Population with Baseline Hemoglobin < 10 g/dL.
Adverse events were mapped according to MedDRA Version 22.0
Multiple AEs were counted only once per subject for each SOC and PT.
SOCs and then PTs within an SOC were presented by descending order of the frequencies under the last column.
The most severe AE within a PT was counted for each subject.
TEAE = Treatment-Emergent Adverse Event; SOC = System Organ Class; PT = Preferred Term

Cardiac disorders	1 (1.6%)	1 (1.2%)	2 (1.4%)	3 (1.8%)

SAF-Anemic Analysis includes subjects in the Safety Population with Baseline Hemoglobin < 10 g/dL.
Adverse events were mapped according to MedDRA Version 22.0
Multiple AEs were counted only once per subject for each SOC and PT.
SOCs and then PTs within an SOC were presented by descending order of the frequencies under the last column.
The most severe AE within a PT was counted for each subject.
TEAE = Treatment-Emergent Adverse Event; SOC = System Organ Class; PT = Preferred Term

Data Extracted: CRF data: 01JUL2019

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
Stratified two-sided p-value is from a log-rank test comparing treatment stratified by baseline TD (yes,no) and baseline TSS (<18,>=18).
Adjusted hazard ratio and 95% CI are from a Cox proportional hazards model with covariates of treatment, baseline TD (yes,no) and baseline TSS (<18,>=18). Unstratified two-sided p-value is from a log-rank test comparing treatment.
Unadjusted hazard ratio and 95% CI are from a Cox proportional hazards model with a covariate of treatment. NE = Not estimable.

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
For Switch (BAT->MMB) group, the baseline is the last assessment prior to or on the date of the 1st dose of MMB in the ET phase.
For Continuing (MMB->MMB) group, the baseline is the last assessment prior to or on the date of randomization.
