ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
For Switch (BAT->MMB) group, the baseline is the last assessment prior to or on the date of the 1st dose of MMB in the ET phase.
For Continuing (MMB->MMB) group, the baseline is the last assessment prior to or on the date of randomization.

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
Stratified two-sided p-value is from a log-rank test comparing treatment stratified by baseline TD (yes,no) and baseline TSS (<18,>=18).
Adjusted hazard ratio and 95% CI are from a Cox proportional hazards model with covariates of treatment, baseline TD (yes,no) and baseline TSS (<18,>=18). Unstratified two-sided p-value is from a log-rank test comparing treatment.
Unadjusted hazard ratio and 95% CI are from a Cox proportional hazards model with a covariate of treatment.
P-value for interaction test is from a Cox proportional hazards model with covariates of treatment, subgroup, baseline TD (yes,no), baseline TSS (<18,>=18) and treatment by subgroup interaction.
MRI = Magnetic Resonance Imaging. CT = Computerized Tomography.

Mean (SD)	3.7 (2.66)	5.6 (2.53)	
Median	3.0	5.0	
Q1, Q3	2.0, 6.0	4.0, 8.0	
Min, Max	0.0, 10.0	0.0, 10.0	
Return Rate (%)	77%	77%	
Number of Subjects in Risk	59	33	
Return Rate in Risk (%)	86%	91%	

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
MPN-SAF = Myeloproliferative Neoplasm Symptom Assessment Form 27-Item Questionnaire.
MPN-SAF questionnaire encompasses the 9-item Brief Fatigue Inventory (BFI).
MMRM model included Treatment, Baseline value, Baseline TD (yes, no) and Baseline TSS (<18, >=18),
Visit and Treatment by Visit interaction as covariates.
[1] Number of subjects with analysable data for one or more time points.
[2] Number of subjects with analysable data at the current time point.

Data Extracted: CRF data: 25JUN2019

Adjusted Inverse Relative Risk (95% CI) [2]	NE		
p-value [2]	NE		

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.

95% Exact CI is based on Clopper-Pearson method without stratification. TSS = Total Symptom Score, CMH = Cochran-Mantel-Haenszel.

Response rate analysis at each visit only includes subjects with item score > 0 at baseline or (score = 0 at baseline and [score > 0 or missing]).

Subjects with item score = 0 at baseline and = 0 at the visit are excluded from response rate analysis but are included in return rate calculations.

Modified Poisson regression model did not converge so these values are presented as NE. NE = Not Estimable.

[1] p-values were obtained from a Z-test.

[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model with robust sandwich matrix estimators, including treatment, baseline TD (yes, no), and baseline TSS (<18, >=18) as covariates.

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
95% Exact CI is based on Clopper-Pearson method without stratification. TSS = Total Symptom Score, CMH = Cochran-Mantel-Haenszel.
Response rate analysis at each visit only includes subjects with item score > 0 at baseline or (score = 0 at baseline and [score > 0 or missing]).
Subjects with item score = 0 at baseline and = 0 at the visit are excluded from response rate analysis but are included in return rate calculations.
Modified Poisson regression model did not converge so these values are presented as NE. NE = Not Estimable.
[1] p-values were obtained from a Z-test.
[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model with robust sandwich matrix estimators, including treatment, baseline TD (yes, no), and baseline TSS (<18, >=18) as covariates.

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
95% Exact CI is based on Clopper-Pearson method without stratification. TSS = Total Symptom Score, CMH = Cochran-Mantel-Haenszel.
Response rate analysis at each visit only includes subjects with item score > 0 at baseline or (score = 0 at baseline and [score > 0 or missing]).
Subjects with item score = 0 at baseline and = 0 at the visit are excluded from response rate analysis but are included in return rate calculations.
Modified Poisson regression model did not converge so these values are presented as NE. NE = Not Estimable.
[1] p-values were obtained from a Z-test.
[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model with robust sandwich matrix estimators, including treatment, baseline TD (yes, no), and baseline TSS (<18, >=18) as covariates.

Table 2.1415: Analysis of Response Rate (improvement, 50% criterion) in TSS Item Score (Itching) by Every 4 Weeks
Randomized Treatment Phase
ITT-Anemic Analysis Set

	MMB (N=66)	BAT (N=39)	Total (N=105)
Non-Responder, n(%)	35 (72.9%)	25 (83.3%)	60 (76.9%)
Last participation date < Day 78 in RT Phase	6 (12.5%)	6 (20.0%)	12 (15.4%)
Last participation date >= Day 78 and Itching Score at Week 12 not available	2 (4.2%)	0	2 (2.6%)
>0% increase from baseline at Week 12	12 (25.0%)	13 (43.3%)	25 (32.1%)
<50% reduction from baseline at Week 12	19 (39.6%)	17 (56.7%)	36 (46.2%)
Return Rate (%)	88%	85%	87%
Number of Subjects in Risk	60	33	93
Return Rate in Risk (%)	97%	100%	98%

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
95% Exact CI is based on Clopper-Pearson method without stratification. TSS = Total Symptom Score, CMH = Cochran-Mantel-Haenszel.
Response rate analysis at each visit only includes subjects with item score > 0 at baseline or (score = 0 at baseline and [score > 0 or missing]).
Subjects with item score = 0 at baseline and = 0 at the visit are excluded from response rate analysis but are included in return rate calculations.
Modified Poisson regression model did not converge so these values are presented as NE. NE = Not Estimable.
[1] p-values were obtained from a Z-test.
[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model with robust sandwich matrix estimators, including treatment, baseline TD (yes, no), and baseline TSS (<18, >=18) as covariates.

p-value [2]	0.50		

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
95% Exact CI is based on Clopper-Pearson method without stratification. TSS = Total Symptom Score, CMH = Cochran-Mantel-Haenszel.
Response rate analysis at each visit only includes subjects with item score > 0 at baseline or (score = 0 at baseline and [score > 0 or missing]).
Subjects with item score = 0 at baseline and = 0 at the visit are excluded from response rate analysis but are included in return rate calculations.
[1] p-values were obtained from a Z-test.
[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model with robust sandwich matrix estimators, including treatment, baseline TD (yes, no), and baseline TSS (<18, >=18) as covariates.

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.

95% Exact CI is based on Clopper-Pearson method without stratification. TSS = Total Symptom Score, CMH = Cochran-Mantel-Haenszel.

Response rate analysis at each visit only includes subjects with item score > 0 at baseline or (score = 0 at baseline and [score > 0 or missing]).

Subjects with item score = 0 at baseline and = 0 at the visit are excluded from response rate analysis but are included in return rate calculations.

Modified Poisson regression model did not converge so these values are presented as NE. NE = Not Estimable.

[1] p-values were obtained from a Z-test.

[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model with robust sandwich matrix estimators, including treatment, baseline TD (yes, no), and baseline TSS (<18, >=18) as covariates.

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
95% Exact CI is based on Clopper-Pearson method without stratification. TSS = Total Symptom Score, CMH = Cochran-Mantel-Haenszel.
Response rate analysis at each visit only includes subjects with item score > 0 at baseline or (score = 0 at baseline and [score > 0 or missing]).
Subjects with item score = 0 at baseline and = 0 at the visit are excluded from response rate analysis but are included in return rate calculations.
Modified Poisson regression model did not converge so these values are presented as NE. NE = Not Estimable.
[1] p-values were obtained from a Z-test.
[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model with robust sandwich matrix estimators, including treatment, baseline TD (yes, no), and baseline TSS (<18, >=18) as covariates.

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
RBC transfusion independent response is defined as the absence of RBC transfusions and no hemoglobin level below 8 g/dL in the prior 12 weeks.
Stratified two-sided p-value is from a log-rank test comparing treatment stratified by baseline TD (yes,no) and baseline TSS (<18,>=18).
Adjusted hazard ratio and 95% CI are from a Cox proportional hazards model with covariates of treatment, baseline TD (yes,no) and baseline TSS (<18,>=18). Unstratified two-sided p-value is from a log-rank test comparing treatment.
Unadjusted hazard ratio and 95% CI are from a Cox proportional hazards model with a covariate of treatment.
P-value for interaction test is from a Cox proportional hazards model with covariates of treatment, subgroup, baseline TD (yes,no), baseline TSS (<18,>=18) and treatment by subgroup interaction. NE = Not estimable.

p-value [1]	0.022		
Unadjusted Inverse Odds Ratio (95% CI)	0.07 (0.01, 0.56)		
p-value [1]	0.012		
Unadjusted Absolute Risk Difference (95% CI)	0.29 (0.16, 0.43)		
Adjusted Inverse Relative Risk (95% CI) [2]	NE		
p-value [2]	NE		
Non-Responder, n(%)	41 (67.2%)	29 (96.7%)	70 (76.9%)
Transfusion (except bleeding) in the last 12 weeks	26 (42.6%)	23 (76.7%)	49 (53.8%)
Any Hgb assessment < 8g/dL in the last 12 weeks	21 (34.4%)	15 (50.0%)	36 (39.6%)
Last Participation date < Day 162 in RT phase	15 (24.6%)	5 (16.7%)	20 (22.0%)
Other	9 (14.8%)	3 (10.0%)	12 (13.2%)

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.

95% Exact CI is based on Clopper-Pearson method without stratification. CMH = Cochran-Mantel-Haenszel, RBC = Red Blood Cell.

[1] p-values were obtained from a Z-test.

[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model with robust sandwich matrix estimators, including treatment, baseline TD (yes, no), and baseline TSS (<18, >=18) as covariates.

Modified Poisson regression model did not converge so these values are presented as NE. NE = Not estimable.

[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model, including treatment, baseline TD (yes, no), and baseline TSS (<18, >=18) as covariates.
[3] The interaction test p-value was obtained for the treatment by subgroup interaction term from the corresponding modified Poisson regression which additionally includes subgroup as covariate and the treatment by subgroup interaction term.
Modified Poisson regression model did not converge so these values are presented as NE. NE = Not estimable.

Discontinued prior to week 24	0	0	1 (2.6%)	2 (6.1%)	

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.

Modified Poisson regression model did not converge so these values are presented as NE. NE = Not Estimable.

[1] p-values were obtained from a Z-test.

[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model, including treatment, baseline TD (yes, no), and baseline TSS (<18, >=18) as covariates.

[3] The interaction test p-value was obtained for the treatment by subgroup interaction term from the corresponding modified Poisson regression which additionally includes subgroup as covariate and the treatment by subgroup interaction term.

Unadjusted Inverse Hazard Ratio (95% CI)	**0.35 (0.08, 1.52)**	

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
RBC transfusion independent response is defined as the absence of RBC transfusions and no hemoglobin level below 8 g/dL in the prior 12 weeks.
Stratified two-sided p-value is from a log-rank test comparing treatment stratified by baseline TD (yes,no) and baseline TSS (<18,>=18).
Adjusted hazard ratio and 95% CI are from a Cox proportional hazards model with covariates of treatment, baseline TD (yes,no) and baseline TSS (<18,>=18). Unstratified two-sided p-value is from a log-rank test comparing treatment.
Unadjusted hazard ratio and 95% CI are from a Cox proportional hazards model with a covariate of treatment. NE = Not estimable.

P-value for interaction test			NA

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
Any type transfusion free response is defined as the absence of transfusion of any type in the prior 12 weeks.
Stratified two-sided p-value is from a log-rank test comparing treatment stratified by baseline TD (yes,no) and baseline TSS (<18,>=18).
Adjusted hazard ratio and 95% CI are from a Cox proportional hazards model with covariates of treatment, baseline TD (yes,no) and baseline TSS (<18,>=18). Unstratified two-sided p-value is from a log-rank test comparing treatment.
Unadjusted hazard ratio and 95% CI are from a Cox proportional hazards model with a covariate of treatment.
P-value for interaction test is from a Cox proportional hazards model with covariates of treatment, subgroup, baseline TD (yes,no), baseline TSS (<18,>=18) and treatment by subgroup interaction. NE = Not estimable.

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
RBC transfusion free response is defined as the absence of RBC transfusions in the prior 12 weeks.
Stratified two-sided p-value is from a log-rank test comparing treatment stratified by baseline TD (yes,no).
Adjusted hazard ratio and 95% CI are from a Cox proportional hazards model with covariates of treatment and baseline TD (yes,no).
Unstratified two-sided p-value is from a log-rank test comparing treatment.
Unadjusted hazard ratio and 95% CI are from a Cox proportional hazards model with a covariate of treatment.
P-value for interaction test is from a Cox proportional hazards model with covariates of treatment, subgroup, baseline TD (yes,no) and treatment by subgroup interaction. NE = Not estimable.

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.

For MMB and BAT group, the baseline is based on the RBC transfusion within 84 days prior to or on the date of randomization. RBC = Red Blood Cell.

Modified Poisson regression model did not converge so these values are presented as NE. NE = Not Estimable.

[1] p-values were obtained from a Z-test.

[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model, including treatment, baseline TD (yes, no), and baseline TSS (<18, >=18) as covariates.

[3] The interaction test p-value was obtained for the treatment by subgroup interaction term from the corresponding modified Poisson regression which additionally includes subgroup as covariate and the treatment by subgroup interaction term.

Unadjusted Inverse Odds Ratio (95% CI)	0.44 (0.17, 1.15)		
p-value [1]	0.093		
Unadjusted Absolute Risk Difference (95% CI)	0.15 (-0.01, 0.32)		
Adjusted Inverse Relative Risk (95% CI) [2]	0.53 (0.27, 1.07)		
p-value [2]	0.078		
Non-responder, n(%)	44 (66.7%)	32 (82.1%)	76 (72.4%)
RBC Transfusion within 12 weeks prior to Week 24	26 (39.4%)	25 (64.1%)	51 (48.6%)
Discontinued prior to week 24	18 (27.3%)	7 (17.9%)	25 (23.8%)

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
For MMB and BAT group, the baseline is based on the RBC transfusion within 84 days prior to or on the date of randomization. RBC = Red Blood Cell.
[1] p-values were obtained from a Z-test.
[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model with robust sandwich matrix estimators, including treatment, baseline TD (yes, no), and baseline TSS (<18, >=18) as covariates.

Non-responder, n(%)	41 (95.3%)	29 (96.7%)	70 (95.9%)
RBC Transfusion within 12 weeks prior to week 156 in ET phase	0	0	0
Discontinued prior to week 156	41 (95.3%)	29 (96.7%)	70 (95.9%)

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
For Switch (BAT->MMB) group, the baseline is based on the RBC transfusion with 84 days prior to or on the date of the 1st MMB dose in the ET phase
For Continuing (MMB->MMB) group, the baseline is based on the RBC transfusion with 84 days prior to or on the date of randomization excluding RBC transfusion associated with clinically overt bleeding.
RBC = Red Blood Cell

Responder, n/N(%)	0	0	4/35 (11.4%)	0

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.

For MMB and BAT group, the baseline is based on any type of transfusion within 84 days prior to or on the date of randomization.

Modified Poisson regression model did not converge so these values are presented as NE. NE = Not Estimable.

[1] p-values were obtained from a Z-test.

[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model with robust sandwich matrix estimators, including treatment, baseline TD (yes, no), and baseline TSS (<18, >=18) as covariates.

[3] The interaction test p-value was obtained for the treatment by subgroup interaction term from the corresponding modified Poisson regression which additionally includes subgroup as covariate and the treatment by subgroup interaction term.

Unstratified Log-Rank Test p-value	0.23		0.32		
Unadjusted Inverse Hazard Ratio (95% CI)	0.58 (0.23, 1.46)		0.55 (0.17, 1.85)		
P-value for interaction test					0.90

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
RBC transfusion free response is defined as the absence of RBC transfusions in the prior 12 weeks.
Stratified two-sided p-value is from a log-rank test comparing treatment stratified by baseline TD (yes,no).
Adjusted hazard ratio and 95% CI are from a Cox proportional hazards model with covariates of treatment and baseline TD (yes,no).
Unstratified two-sided p-value is from a log-rank test comparing treatment.
Unadjusted hazard ratio and 95% CI are from a Cox proportional hazards model with a covariate of treatment.
P-value for interaction test is from a Cox proportional hazards model with covariates of treatment, subgroup, baseline TD (yes,no) and treatment by subgroup interaction. NE = Not estimable.

Adjusted interaction test for Treatment*DIPSS 3-Level Risk [3]			0.82

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
95% Exact CI is based on Clopper-Pearson method without stratification. CMH = Cochran-Mantel-Haenszel; RBC = Red Blood Cell
[1] p-values were obtained from a Z-test.
[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model, including treatment, baseline TD (yes, no), and baseline TSS (<18, >=18) as covariates.
[3] The interaction test p-value was obtained for the treatment by subgroup interaction term from the corresponding modified Poisson regression which additionally includes subgroup as covariate and the treatment by subgroup interaction term.
Modified Poisson regression model did not converge so these values are presented as NE. NE = Not estimable.

Min, Max	0.95, 5.78	0.43, 5.78	0.92, 5.78	0.66, 5.78	

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
Proportional means model is Andersen-Gill model with robust sandwich variance estimate.
[1] The interaction test p-value was obtained for the treatment by subgroup interaction term from the corresponding Negative Binomial regression which additionally includes subgroup as covariate and the treatment by subgroup interaction term.
RBC = Red Blood Cell.

Unstratified Log-Rank Test p-value	0.18		
Unadjusted Hazard Ratio (95% CI)	0.52 (0.20, 1.36)		
P-value for interaction test			0.22

ITT-Anemic Analysis includes subjects in the Intent-to-Treat Population with Baseline Hemoglobin < 10 g/dL.
Stratified two-sided p-value is from a log-rank test comparing treatment stratified by baseline TD (yes,no) and baseline TSS (<18,>=18).
Adjusted hazard ratio and 95% CI are from a Cox proportional hazards model with covariates of treatment, baseline TD (yes,no) and baseline TSS (<18,>=18). Unstratified two-sided p-value is from a log-rank test comparing treatment.
Unadjusted hazard ratio and 95% CI are from a Cox proportional hazards model with a covariate of treatment.
P-value for interaction test is from a Cox proportional hazards model with covariates of treatment, subgroup, baseline TD (yes,no), baseline TSS (<18,>=18) and treatment by subgroup interaction. NE = Not estimable.

TEAE = Treatment-Emergent Adverse Event
[1] p-values were obtained from a Z-test.
[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model, including treatment, baseline TD (yes, no), and baseline TSS (<18, >=18) as covariates. Modified Poisson regression model did not converge for some categories so these values are presented as NE.

Adjusted Relative Risk (95% CI) [2]	NE					
p-value [2]	NE					

SAF-Anemic Analysis includes subjects in the Safety Population with Baseline Hemoglobin < 10 g/dL.
TEAE = Treatment-Emergent Adverse Event; SOC = System Organ Class; PT = Preferred Term. Adverse events were mapped according to MedDRA Version 22.0.
Multiple AEs were counted only once per subject for each SOC and PT.
SOCs, and then PTs within a SOC were presented by descending order of the frequencies under "MMB" column.
[1] p-values were obtained from a Z-test.
[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model, including treatment, baseline TD (yes, no), and baseline TSS (<18, >=18) as covariates. Modified Poisson regression model did not converge for some categories so these values are presented as NE.

p-value [2]	NE					

SAF-Anemic Analysis includes subjects in the Safety Population with Baseline Hemoglobin < 10 g/dL.
TEAE = Treatment-Emergent Adverse Event; SOC = System Organ Class; PT = Preferred Term. Adverse events were mapped according to MedDRA Version 22.0.
Multiple AEs were counted only once per subject for each SOC and PT.
SOCs, and then PTs within a SOC were presented by descending order of the frequencies under "MMB" column.
[1] p-values were obtained from a Z-test.
[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model, including treatment, baseline TD (yes, no), and baseline TSS (<18, >=18) as covariates. Modified Poisson regression model did not converge for some categories so these values are presented as NE.

p-value [2]	1.00					

SAF-Anemic Analysis includes subjects in the Safety Population with Baseline Hemoglobin < 10 g/dL.
TEAE = Treatment-Emergent Adverse Event; SOC = System Organ Class; PT = Preferred Term. Adverse events were mapped according to MedDRA Version 22.0.
Multiple AEs were counted only once per subject for each SOC and PT.
SOCs, and then PTs within a SOC were presented by descending order of the frequencies under "MMB" column.
[1] p-values were obtained from a Z-test.
[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model, including treatment, baseline TD (yes, no), and baseline TSS (<18, >=18) as covariates. Modified Poisson regression model did not converge for some categories so these values are presented as NE.

Adjusted Relative Risk (95% CI) [2]	0.81 (0.21, 3.20)					
p-value [2]	0.77					

SAF-Anemic Analysis includes subjects in the Safety Population with Baseline Hemoglobin < 10 g/dL.
TEAE = Treatment-Emergent Adverse Event; SOC = System Organ Class; PT = Preferred Term. Adverse events were mapped according to MedDRA Version 22.0.
Severity grades were defined by CTCAE Version 4.03. Multiple AEs were counted only once per subject for each SOC and PT.
SOCs, and then PTs within a SOC were presented by descending order of the frequencies under "MMB" column.
[1] p-values were obtained from a Z-test.
[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model, including treatment, baseline TD (yes, no), and baseline TSS (<18, >=18) as covariates. Modified Poisson regression model did not converge for some categories so these values are presented as NE.

p-value [2]	0.88					

SAF-Anemic Analysis includes subjects in the Safety Population with Baseline Hemoglobin < 10 g/dL.
TEAE = Treatment-Emergent Adverse Event; SOC = System Organ Class; PT = Preferred Term. Adverse events were mapped according to MedDRA Version 22.0.
Severity grades were defined by CTCAE Version 4.03. Multiple AEs were counted only once per subject for each SOC and PT.
SOCs, and then PTs within a SOC were presented by descending order of the frequencies under "MMB" column.
[1] p-values were obtained from a Z-test.
[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model, including treatment, baseline TD (yes, no), and baseline TSS (<18, >=18) as covariates. Modified Poisson regression model did not converge for some categories so these values are presented as NE.

Adjusted Relative Risk (95% CI) [2]	NE					
p-value [2]	NE					

SAF-Anemic Analysis includes subjects in the Safety Population with Baseline Hemoglobin < 10 g/dL.
TEAE = Treatment-Emergent Adverse Event; SOC = System Organ Class; PT = Preferred Term. Adverse events were mapped according to MedDRA Version 22.0.
Severity grades were defined by CTCAE Version 4.03. Multiple AEs were counted only once per subject for each SOC and PT.
SOCs, and then PTs within a SOC were presented by descending order of the frequencies under "MMB" column.
[1] p-values were obtained from a Z-test.
[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model, including treatment, baseline TD (yes, no), and baseline TSS (<18, >=18) as covariates. Modified Poisson regression model did not converge for some categories so these values are presented as NE.

Severity grades were defined by CTCAE Version 4.03. Multiple AEs were counted only once per subject for each SOC and PT.
SOCs, and then PTs within a SOC were presented by descending order of the frequencies under "MMB" column.
[1] p-values were obtained from a Z-test.
[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model, including treatment, baseline TD (yes, no), and baseline TSS (<18, >=18) as covariates. Modified Poisson regression model did not converge for some categories so these values are presented as NE.

SOCs, and then PTs within a SOC were presented by descending order of the frequencies under "MMB" column.
[1] p-values were obtained from a Z-test.
[2] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model, including treatment, baseline TD (yes, no), and baseline TSS (<18, >=18) as covariates. Modified Poisson regression model did not converge for some categories so these values are presented as NE.

Missing baseline evaluation	0	0	0
Missing Week 24 visit evaluation	38 (29.2%)	28 (43.1%)	66 (33.8%)
Scan taken more than 10 days after the start of OL treatment	2 (1.5%)	0	2 (1.0%)
Subjects with differing modalities of spleen scan at baseline and week 24 visit	2 (1.5%)	0	2 (1.0%)
Subjects with <25% reduction or increased spleen volume	36 (27.7%)	33 (50.8%)	69 (35.4%)
Subjects with prohibited medication during RT period	5 (3.8%)	1 (1.5%)	6 (3.1%)

Notes: Splenic response rate (SRR) is defined as the proportion of subjects who have reduction in spleen volume of >= 25% from baseline at the end of Week 24. Results are based on central (or local, when central is not available) spleen volumetric assessment.
Imaging modality and assessment method (central or local) must match at baseline and Week 24. CMH = Cochran-Mantel-Haenszel.
[1] Exact binomial confidence interval. [2] 95% Exact CI is based on Clopper-Pearson method without stratification.
[3] p-values were from a Z-test.
[4] Adjusted Relative Risk and corresponding p-value were obtained from a modified Poisson regression model with robust sandwich matrix estimators, including treatment, Baseline MFSAF TSS (<22, >=22), Baseline palpable spleen length below the left costal margin (<12cm, >=12cm) and Baseline RBC units transfused in the 8-week period prior to Randomization (0, 1-4, 5+) as covariates.

Notes: MFSAF = Myelofibrosis Symptom Assessment Form (MFSAF) v4.0.

[1] Least squares mean (SE), least squares mean difference (SE), and confidence intervals (95%) are from mixed model for repeated measures (MMRM) including terms for treatment arm, timepoint (week), treatment-by-week interaction, MFSAF TSS baseline score (<22, >=22), baseline palpable spleen length below the left costal margin (<12 cm, >=12 cm), and baseline RBC units transfused in the 8-week period prior to Randomization (0, 1-4, 5+).

[2] p-value for the least squares mean difference between the two arms from the MMRM.

Data Extracted: CRF data: 13JAN2022

Table 2.0504: MFSAF Total Symptom Score (TSS) Individual Item Score Change From Baseline Over the 24-Week Randomized Treatment Period - Abdominal Discomfort

Intent-To-Treat (ITT) Analysis Set

	MMB (N=130)	DAN (N=65)	Total (N=195)
Percent Change from Baseline			
n (%)	87 (66.9%)	35 (53.8%)	122 (62.6%)
Mean (SD)	-33.97 (55.42)	37.45 (325.62)	-13.48 (181.74)
Median	-39.58	-15.26	-35.09
Q1, Q3	-77.14, -2.27	-52.79, 20.16	-67.98, 0.86
Min, Max	-100.0, 230.6	-100.0, 1875.0	-100.0, 1875.0
Return Rate (%)	71%	57%	
Number of Subjects in Risk	99	39	
Return Rate in Risk (%)	93%	95%	

Notes: MFSAF = Myelofibrosis Symptom Assessment Form (MFSAF) v4.0.

[1] Least squares mean (SE), least squares mean difference (SE), and confidence intervals (95%) are from mixed model for repeated measures (MMRM) including terms for treatment arm, timepoint (week), treatment-by-week interaction, MFSAF TSS baseline score (<22, >=22), baseline palpable spleen length below the left costal margin (<12 cm, >=12 cm), and baseline RBC units transfused in the 8-week period prior to Randomization (0, 1-4, 5+).

[2] p-value for the least squares mean difference between the two arms from the MMRM.

Table 2.1104: Physical Function (PROMIS) Individual Item Score Change From Baseline Over the 24-Week Randomized Treatment Period - Daily Physical Activities

Intent-To-Treat (ITT) Analysis Set

	MMB (N=130)	DAN (N=65)
Percent Change from Baseline		
n (%)	121 (93.1%)	52 (80.0%)
Mean (SD)	9.35 (42.30)	-5.64 (40.41)
Median	0.00	0.00
Q1, Q3	0.00, 33.33	-25.00, 0.00
Min, Max	-50.0, 300.0	-75.0, 200.0
Return Rate (%)	94%	82%
Number of Subjects in Risk	130	65
Return Rate in Risk (%)	94%	82%

[1] Least squares mean (SE), least squares mean difference (SE), and confidence intervals (95%) are from mixed model for repeated measures (MMRM) including terms for treatment arm, timepoint (week), treatment-by-week interaction, MFSAF TSS baseline score (<22, >=22), baseline palpable spleen length below the left costal margin (<12cm, >=12cm), and baseline RBC units transfused in the 8-week period prior to Randomization (0, 1-4, 5+).

[2] p-value for the least squares mean difference between the two arms from the MMRM.

Table 2.1402: Analysis of Patient Global Impression of Severity of Fatigue Change From Baseline Over the 24-Week Randomized Treatment Period
Intent-To-Treat (ITT) Analysis Set

	MMB (N=130)	DAN (N=65)
Percent Change from Baseline		
n (%)	121 (93.1%)	53 (81.5%)
Mean (SD)	-8.61 (26.85)	6.76 (43.64)
Median	0.00	0.00
Q1, Q3	-25.00, 0.00	0.00, 0.00
Min, Max	-75.0, 100.0	-50.0, 200.0
Return Rate (%)	95%	82%
Number of Subjects in Risk	130	65
Return Rate in Risk (%)	95%	82%

[1] Least squares mean (SE), least squares mean difference (SE), and confidence intervals (95%) are from mixed model for repeated measures (MMRM) including terms for treatment arm, timepoint (week), treatment-by-week interaction, MFSAF TSS baseline score (<22, >=22), baseline palpable spleen length below the left costal margin (<12 cm, >=12 cm), and baseline RBC units transfused in the 8-week period prior to Randomization (0, 1-4, 5+).
[2] p-value for the least squares mean difference between the two arms from the MMRM.

[1] Least squares mean (SE), least squares mean difference (SE), and confidence intervals (95%) are from mixed model for repeated measures (MMRM) including terms for treatment arm, timepoint (week), treatment-by-week interaction, MFSAF TSS baseline score (<22, >=22), baseline palpable spleen length below the left costal margin (<12cm, >=12cm), and baseline RBC units transfused in the 8-week period prior to Randomization (0, 1-4, 5+).
[2] p-value for the least squares mean difference between the two arms from the MMRM.

[1] Least squares mean (SE), least squares mean difference (SE), and confidence intervals (95%) are from mixed model for repeated measures (MMRM) including terms for treatment arm, timepoint (week), treatment-by-week interaction, MFSAF TSS baseline score (<22, >=22), baseline palpable spleen length below the left costal margin (<12cm, >=12cm), and baseline RBC units transfused in the 8-week period prior to Randomization (0, 1-4, 5+).
[2] p-value for the least squares mean difference between the two arms from the MMRM.
