Summary of EORTC QLQ-C30 Time to First Deterioration (Up to and Including Last Follow-Up) by Prior Lines of Therapy 2 - Lenalidomide and Anti-CD38 Refractory Subpopulation

Item Score: Nausea and Vomiting Domain Score

Subgroup		Belamaf 2.5/1.9 mg/kg + POM/DEX (N=30)	POM + BOR/DEX (N=33)
1/2/3	Number of subjects in subgroup, n*(%)	21 (70%)	20 (61%)
	Number of Subjects		
	Deteriorated (event)	10 (48%)	9 (45%)
	Censored, follow-up ended	8 (38%)	9 (45%)
	Censored, follow-up ongoing	3 (14%)	2 (10%)
	Estimates for Time Variable (Months) [1]		
	1st Quartile (95% CI)	3.8 (1.0, 11.0)	5.7 (1.0, 9.3)
	Median (95% CI)	11.0 (3.8, -)	9.3 (3.7, -)
	3rd Quartile (95% CI)	- (11.0, -)	43.7 (8.7, -)
	Log-Rank P-value [2]	0.83092	
	Hazard Ratio (95% CI) [3]	1.11 (0.43, 2.82)	
	P-value [3]	0.83128	

Note: The percentage for n* is calculated by taking N as denominator. For all subsequent rows, n* is used as denominator for percentage calculation. Subjects are censored at the latest post-baseline assessment or at treatment initiation if no post-baseline assessments. Patients without treatment initiation are censored at 0 months. [1] CIs for time variables are estimated using the Brookmeyer-Crowley method. [2] Two-sided p-value obtained from unstratified log-rank test. [3] HR and associated p-value are estimated using the unstratified Cox PH model (Firth correction as applicable) with treatment arm as the only covariate. [4] p-value of the interaction test based on a Cox PH model (Firth correction as applicable) with treatment, subgroup, and treatment x subgroup interaction included as covariates in the model.

Population: Intent-to-Treat - Global Cohort (Len. & anti-CD38 ref.) Data as of 07JUL2025

Table 4.0001205
Analysis of EORTC QLQ-C30 Domain Scores based on Mixed Model for Repeated Measures (MMRM) - Lenalidomide and Anti-CD38 Refractory Subpopulation

Domain: Global Health Status

	Belamaf 2.5/1.9 mg/kg + POM/DEX (N=30)	POM + BOR/DEX (N=33)
Week 37		
n [1]	25	30
n [2]	13	9
LS Mean (SE)	56.3 (4.29)	68.0 (5.18)
95% C.I.	(47.9, 64.8)	(57.8, 78.2)
LS Mean Change from Baseline (SE)	-0.8 (4.29)	10.9 (5.18)
95% C.I.	(-9.2, 7.7)	(0.7, 21.1)
Belmaf 2.5/1.9 mg/kg + POM/DEX vs. POM + BOR/DEX		
Difference (SE)	-11.7 (6.81)	
95% C.I.	(-25.0, 1.7)	
p-value	0.08767	
Corrected Hedges' g	-0.72	
95% C.I.	(-1.60, 0.15)	

[1] Number of subjects with analyzable data for one or more time points.
[2] Number of subjects with analyzable data at the current time point.
Note: Analysis performed using a repeated measures model with covariates of treatment group, visit, baseline value, treatment by visit interactions and baseline value by visit interactions as fixed effects and subject as a random effect.
Note: Visits are only included in the model if the number of subjects with analyzable data at the current time point is >= 10 across treatments. An Autoregressive (AR(1)) covariance structure was used to estimate the within subject covariance.

[1] Number of subjects with analyzable data for one or more time points.
[2] Number of subjects with analyzable data at the current time point.
Note: Analysis performed using a repeated measures model with covariates of treatment group, visit, baseline value, treatment by visit interactions and baseline value by visit interactions as fixed effects and subject as a random effect.
Note: Visits are only included in the model if the number of subjects with analyzable data at the current time point is >= 10 across treatments. An Autoregressive (AR(1)) covariance structure was used to estimate the within subject covariance.

[2] Number of subjects with analyzable data at the current time point.
Note: Analysis performed using a repeated measures model with covariates of treatment group, visit, baseline value, treatment by visit interactions and baseline value by visit interactions as fixed effects and subject as a random effect.
Note: Visits are only included in the model if the number of subjects with analyzable data at the current time point is >= 10 across treatments. An Autoregressive (AR(1)) covariance structure was used to estimate the within subject covariance.

[1] Number of subjects with analyzable data for one or more time points.
[2] Number of subjects with analyzable data at the current time point.
Note: Analysis performed using a repeated measures model with covariates of treatment group, visit, baseline value, treatment by visit interactions and baseline value by visit interactions as fixed effects and subject as a random effect.
Note: Visits are only included in the model if the number of subjects with analyzable data at the current time point is >= 10 across treatments. An Autoregressive (AR(1)) covariance structure was used to estimate the within subject covariance.

	Belamaf 2.5/1.9 mg/kg + POM/DEX (N=30)	POM + BOR/DEX (N=33)
Week 185		
n [1]	24	30
n [2]	3	1

[1] Number of subjects with analyzable data for one or more time points.
[2] Number of subjects with analyzable data at the current time point.
Note: Analysis performed using a repeated measures model with covariates of treatment group, visit, baseline value, treatment by visit interactions and baseline value by visit interactions as fixed effects and subject as a random effect.
Note: Visits are only included in the model if the number of subjects with analyzable data at the current time point is >= 10 across treatments. An Autoregressive (AR(1)) covariance structure was used to estimate the within subject covariance.

[2] Number of subjects with analyzable data at the current time point.
Note: Analysis performed using a repeated measures model with covariates of treatment group, visit, baseline value, treatment by visit interactions and baseline value by visit interactions as fixed effects and subject as a random effect.
Note: Visits are only included in the model if the number of subjects with analyzable data at the current time point is >= 10 across treatments. An Autoregressive (AR(1)) covariance structure was used to estimate the within subject covariance.

Note: Analysis performed using a repeated measures model with covariates of treatment group, visit, baseline value, treatment by visit interactions and baseline value by visit interactions as fixed effects and subject as a random effect.
Note: Visits are only included in the model if the number of subjects with analyzable data at the current time point is >= 10 across treatments. An Autoregressive (AR(1)) covariance structure was used to estimate the within subject covariance.

[1] Number of subjects with analyzable data for one or more time points.
[2] Number of subjects with analyzable data at the current time point.
Note: Analysis performed using a repeated measures model with covariates of treatment group, visit, baseline value, treatment by visit interactions and baseline value by visit interactions as fixed effects and subject as a random effect.
Note: Visits are only included in the model if the number of subjects with analyzable data at the current time point is >= 10 across treatments. An Autoregressive (AR(1)) covariance structure was used to estimate the within subject covariance.

[2] Number of subjects with analyzable data at the current time point.
Note: Analysis performed using a repeated measures model with covariates of treatment group, visit, baseline value, treatment by visit interactions and baseline value by visit interactions as fixed effects and subject as a random effect.
Note: Visits are only included in the model if the number of subjects with analyzable data at the current time point is >= 10 across treatments. An Autoregressive (AR(1)) covariance structure was used to estimate the within subject covariance.

[1] Number of subjects with analyzable data for one or more time points.
[2] Number of subjects with analyzable data at the current time point.
Note: Analysis performed using a repeated measures model with covariates of treatment group, visit, baseline value, treatment by visit interactions and baseline value by visit interactions as fixed effects and subject as a random effect.
Note: Visits are only included in the model if the number of subjects with analyzable data at the current time point is >= 10 across treatments. An Autoregressive (AR(1)) covariance structure was used to estimate the within subject covariance.

	Belamaf 2.5/1.9 mg/kg + POM/DEX (N=30)	POM + BOR/DEX (N=33)
Week 61		
n [1]	24	29
n [2]	10	6
LS Mean (SE)	11.0 (3.92)	3.8 (4.92)
95% C.I.	(3.3, 18.7)	(-5.9, 13.5)
LS Mean Change from Baseline (SE)	4.6 (3.92)	-2.6 (4.92)
95% C.I.	(-3.1, 12.3)	(-12.2, 7.1)
Belmaf 2.5/1.9 mg/kg + POM/DEX vs. POM + BOR/DEX		
Difference (SE)	7.2 (6.30)	
95% C.I.	(-5.2, 19.6)	
p-value	0.25620	
Corrected Hedges' g	0.55	
95% C.I.	(-0.48, 1.58)	

[1] Number of subjects with analyzable data for one or more time points.
[2] Number of subjects with analyzable data at the current time point.
Note: Analysis performed using a repeated measures model with covariates of treatment group, visit, baseline value, treatment by visit interactions and baseline value by visit interactions as fixed effects and subject as a random effect.
Note: Visits are only included in the model if the number of subjects with analyzable data at the current time point is >= 10 across treatments. An Autoregressive (AR(1)) covariance structure was used to estimate the within subject covariance.

[1] Number of subjects with analyzable data for one or more time points.
[2] Number of subjects with analyzable data at the current time point.
Note: Analysis performed using a repeated measures model with covariates of treatment group, visit, baseline value, treatment by visit interactions and baseline value by visit interactions as fixed effects and subject as a random effect.
Note: Visits are only included in the model if the number of subjects with analyzable data at the current time point is >= 10 across treatments. An Autoregressive (AR(1)) covariance structure was used to estimate the within subject covariance.

[1] Number of subjects with analyzable data for one or more time points.
[2] Number of subjects with analyzable data at the current time point.
Note: Analysis performed using a repeated measures model with covariates of treatment group, visit, baseline value, treatment by visit interactions and baseline value by visit interactions as fixed effects and subject as a random effect.
Note: Visits are only included in the model if the number of subjects with analyzable data at the current time point is >= 10 across treatments. An Autoregressive (AR(1)) covariance structure was used to estimate the within subject covariance.

Corrected Hedges' g	1.42	
95% C.I.	(0.23, 2.61)	

[1] Number of subjects with analyzable data for one or more time points.
[2] Number of subjects with analyzable data at the current time point.
Note: Analysis performed using a repeated measures model with covariates of treatment group, visit, baseline value, treatment by visit interactions and baseline value by visit interactions as fixed effects and subject as a random effect.
Note: Visits are only included in the model if the number of subjects with analyzable data at the current time point is >= 10 across treatments. An Autoregressive (AR(1)) covariance structure was used to estimate the within subject covariance.

[1] Number of subjects with analyzable data for one or more time points.
[2] Number of subjects with analyzable data at the current time point.
Note: Analysis performed using a repeated measures model with covariates of treatment group, visit, baseline value, treatment by visit interactions and baseline value by visit interactions as fixed effects and subject as a random effect.
Note: Visits are only included in the model if the number of subjects with analyzable data at the current time point is >= 10 across treatments. An Autoregressive (AR(1)) covariance structure was used to estimate the within subject covariance.

[1] Number of subjects with analyzable data for one or more time points.
[2] Number of subjects with analyzable data at the current time point.
Note: Analysis performed using a repeated measures model with covariates of treatment group, visit, baseline value, treatment by visit interactions and baseline value by visit interactions as fixed effects and subject as a random effect.
Note: Visits are only included in the model if the number of subjects with analyzable data at the current time point is >= 10 across treatments. An Autoregressive (AR(1)) covariance structure was used to estimate the within subject covariance.

[1] Number of subjects with analyzable data for one or more time points.
[2] Number of subjects with analyzable data at the current time point.
Note: Analysis performed using a repeated measures model with covariates of treatment group, visit, baseline value, treatment by visit interactions and baseline value by visit interactions as fixed effects and subject as a random effect.
Note: Visits are only included in the model if the number of subjects with analyzable data at the current time point is >= 10 across treatments. An Autoregressive (AR(1)) covariance structure was used to estimate the within subject covariance.

Analysis of EORTC QLQ-C30 Domain Scores based on Mixed Model for Repeated Measures (MMRM) - Lenalidomide and Anti-CD38 Refractory Subpopulation

Domain: Diarrhea

	Belamaf 2.5/1.9 mg/kg + POM/DEX (N=30)	POM + BOR/DEX (N=33)
Week 97		
n [1]	25	30
n [2]	7	5
LS Mean (SE)	7.0 (7.65)	5.7 (9.15)
95% C.I.	(-8.0, 22.1)	(-12.3, 23.7)
LS Mean Change from Baseline (SE)	-7.1 (7.65)	-8.5 (9.15)
95% C.I.	(-22.2, 7.9)	(-26.5, 9.5)
Belmaf 2.5/1.9 mg/kg + POM/DEX vs. POM + BOR/DEX		
Difference (SE)	1.4 (11.95)	
95% C.I.	(-22.1, 24.8)	
p-value	0.90974	
Corrected Hedges' g	0.06	
95% C.I.	(-1.09, 1.21)	

[1] Number of subjects with analyzable data for one or more time points.
[2] Number of subjects with analyzable data at the current time point.
Note: Analysis performed using a repeated measures model with covariates of treatment group, visit, baseline value, treatment by visit interactions and baseline value by visit interactions as fixed effects and subject as a random effect.
Note: Visits are only included in the model if the number of subjects with analyzable data at the current time point is >= 10 across treatments. An Autoregressive (AR(1)) covariance structure was used to estimate the within subject covariance.

	Belamaf 2.5/1.9 mg/kg + POM/DEX (N=30)	POM + BOR/DEX (N=33)
Week 173		
n [1]	25	30
n [2]	5	1

[1] Number of subjects with analyzable data for one or more time points.
[2] Number of subjects with analyzable data at the current time point.
Note: Analysis performed using a repeated measures model with covariates of treatment group, visit, baseline value, treatment by visit interactions and baseline value by visit interactions as fixed effects and subject as a random effect.
Note: Visits are only included in the model if the number of subjects with analyzable data at the current time point is >= 10 across treatments. An Autoregressive (AR(1)) covariance structure was used to estimate the within subject covariance.

[1] Number of subjects with analyzable data for one or more time points.
[2] Number of subjects with analyzable data at the current time point.
Note: Analysis performed using a repeated measures model with covariates of treatment group, visit, baseline value, treatment by visit interactions and baseline value by visit interactions as fixed effects and subject as a random effect.
Note: Visits are only included in the model if the number of subjects with analyzable data at the current time point is >= 10 across treatments. An Autoregressive (AR(1)) covariance structure was used to estimate the within subject covariance.

n [2]	3	1

[1] Number of subjects with analyzable data for one or more time points.
[2] Number of subjects with analyzable data at the current time point.
Note: Analysis performed using a repeated measures model with covariates of treatment group, visit, baseline value, treatment by visit interactions and baseline value by visit interactions as fixed effects and subject as a random effect.
Note: Visits are only included in the model if the number of subjects with analyzable data at the current time point is >= 10 across treatments. An Autoregressive (AR(1)) covariance structure was used to estimate the within subject covariance.

[1] Number of subjects with analyzable data for one or more time points.
[2] Number of subjects with analyzable data at the current time point.
Note: Analysis performed using a repeated measures model with covariates of treatment group, visit, baseline value, treatment by visit interactions and baseline value by visit interactions as fixed effects and subject as a random effect.
Note: Visits are only included in the model if the number of subjects with analyzable data at the current time point is >= 10 across treatments. An autoregressive with heterogeneity (ARH(1)) covariance structure was used to estimate the within subject covariance.

[2] Number of subjects with analyzable data at the current time point.
Note: Analysis performed using a repeated measures model with covariates of treatment group, visit, baseline value, treatment by visit interactions and baseline value by visit interactions as fixed effects and subject as a random effect.
Note: Visits are only included in the model if the number of subjects with analyzable data at the current time point is >= 10 across treatments. A Toeplitz with heterogeneity (TOEPH) covariance structure was used to estimate the within subject covariance.

Analysis of EQ-5D-3L VAS Domain Scores based on Mixed Model for Repeated Measures (MMRM) - Lenalidomide and Anti-CD38 Refractory Subpopulation

Domain: EQ VAS Score

	Belamaf 2.5/1.9 mg/kg + POM/DEX (N=30)	POM + BOR/DEX (N=33)
Week 205		
n [1]	25	30
n [2]	0	1

[1] Number of subjects with analyzable data for one or more time points.
[2] Number of subjects with analyzable data at the current time point.
Note: Analysis performed using a repeated measures model with covariates of treatment group, visit, baseline value, treatment by visit interactions and baseline value by visit interactions as fixed effects and subject as a random effect.
Note: Visits are only included in the model if the number of subjects with analyzable data at the current time point is >= 10 across treatments. A Toeplitz with heterogeneity (TOEPH) covariance structure was used to estimate the within subject covariance.
/mnt/code/sSAP/sSAP02/prod/tfls/t_pro_eqchg_mmrm_2ref.sas 09OCT2025 09:12

Protocol: 207499 Page 27 of 27
Population: Intent-to-Treat - Global Cohort (Len. & anti-CD38 ref.) Data as of 07JUL2025

Analysis of FACT-GP5 Scores based on Generalised Linear Mixed Model (GLMM) - Lenalidomide and Anti-CD38 Refractory Subpopulation

Timepoint: Week 13

	Belamaf 2.5/1.9 mg/kg + POM/DEX (N=28)	POM + BOR/DEX (N=33)
n	22	27
Bothered	16 (73%)	12 (44%)
Not Bothered	6 (27%)	15 (56%)
Adjusted OR (95% CI) [1] vs. POM + BOR/DEX	4.19 (0.51, 34.53)	
P-Value [1]	0.18278	

Note: Percentages are based on n.
[1] Analysis performed using a GLMM with covariates of treatment group, visit, baseline value, treatment by visit interactions and baseline value by visit interactions as fixed effects, and subject as a random effect.
Visits are only included in the model if the number of subjects with analyzable data at the current time point is >= 10 across treatments. Unstructured covariance structure was used to estimate the within subject covariance. Two-sided P-value is presented.

Note: Percentages are based on n.
[1] Analysis performed using a GLMM with covariates of treatment group, visit, baseline value, treatment by visit interactions and baseline value by visit interactions as fixed effects, and subject as a random effect.
Visits are only included in the model if the number of subjects with analyzable data at the current time point is >= 10 across treatments. Unstructured covariance structure was used to estimate the within subject covariance. Two-sided P-value is presented.

[1] Analysis performed using a GLMM with covariates of treatment group, visit, baseline value and treatment by visit interactions as fixed effects, and subject as a random effect. Visits are only included in the model if the number of subjects with analyzable data at the current time point is >= 10 across treatments. Unstructured covariance structure was used to estimate the within subject covariance. Two-sided P-value is presented.

Table 4.0004305

Summary of Return Rates of PRO-CTCAE, OSDI, EORTC QLQ-C30, EORTC QLQ-MY20, EORTC QLQ-IL52, EQ-5D-3L VAS, FACT-GP5, PGIS and PGIC by Visit (Safety Population) - Lenalidomide and Anti-CD38 Refractory Subpopulation

Timepoint		Belamaf 2.5/1.9 mg/kg + POM/DEX (N=28)	POM + BOR/DEX (N=33)
EPRO SURVIVAL FOLLOW-UP 1	# of subjects with OSDI summary score (%)	6 (21%)	0
	# of subjects with QLQ-C30 summary score (%)	9 (32%)	8 (24%)
	# of subjects with QLQ-MY20 domain score (%)	5 (18%)	1 (3%)
	# of subjects with QLQ-IL52 domain score (%)	9 (32%)	8 (24%)
	# of subjects with EQ-5D-3L VAS score (%)	9 (32%)	8 (24%)
EPRO SURVIVAL FOLLOW-UP 2	# of subjects with OSDI summary score (%)	5 (18%)	0
	# of subjects with QLQ-C30 summary score (%)	7 (25%)	7 (21%)
	# of subjects with QLQ-MY20 domain score (%)	3 (11%)	1 (3%)
	# of subjects with QLQ-IL52 domain score (%)	7 (25%)	7 (21%)
	# of subjects with EQ-5D-3L VAS score (%)	7 (25%)	7 (21%)
EPRO SURVIVAL FOLLOW-UP 3	# of subjects with OSDI summary score (%)	3 (11%)	0
	# of subjects with QLQ-C30 summary score (%)	6 (21%)	7 (21%)
	# of subjects with QLQ-MY20 domain score (%)	4 (14%)	1 (3%)
	# of subjects with QLQ-IL52 domain score (%)	6 (21%)	7 (21%)
	# of subjects with EQ-5D-3L VAS score (%)	6 (21%)	7 (21%)

Note: Percentage is calculated using the number of subjects in each treatment group as denominator.
Note: OSDI assessments are performed every 4 weeks up to Week 21 and every 8 weeks thereafter. EQ-5D-3L VAS assessments are performed every 8 weeks. PRO-CTCAE, EORTC QLQ-C30, EORTC QLQ-MY20, EORTC QLQ-IL52, FACT-GP5, PGIS, and PGIC assessments are performed every 4 weeks.
Note: For the MY20, only subjects enrolled following PA1 will be included.

Table 3.0010505
Time to First Treatment Emergent Adverse Event -
Lenalidomide and Anti-CD38 Refractory Subpopulation

	Belamaf 2.5/1.9 mg/kg + POM/DEX (N=28)	POM + BOR/DEX (N=33)
Number of Subjects		
Event	27 (96%)	32 (97%)
Censored	1 (4%)	1 (3%)
Estimates for Time Variable (Months) [1]		
1st Quartile (95% CI)	0.1 (0.0, 0.3)	0.1 (0.0, 0.1)
Median (95% CI)	0.3 (0.1, 0.6)	0.2 (0.1, 0.3)
3rd Quartile (95% CI)	0.8 (0.3, 1.9)	0.6 (0.3, 1.6)
Log-Rank P-value [2]	0.59361	
Hazard Ratio (95% CI) [3]	0.88 (0.53, 1.47)	
P-value [3]	0.62501	

Note: Subjects are censored at the earliest date out of the following: Treatment end date + 70 days, new anti-cancer therapy date, or last contact date.
[1] Confidence intervals for time variables are estimated using the Brookmeyer-Crowley method.
[2] Two-sided p-value obtained from unstratified log-rank test.
[3] Hazard ratio and associated p-value are estimated using the unstratified Cox Proportional Hazards model (Firth correction as applicable) with treatment arm as the only covariate. A hazard ratio <1 indicates a lower risk with this treatment compared with POM+BOR/DEX.

Note: The percentage for n* is calculated by taking N as denominator. For all subsequent rows, n* is used as denominator for percentage calculation. Subjects are censored at the earliest date out of the following: Treatment end date + 70 days, new anti-cancer therapy date, or last contact date. SOCs that have a p-value <0.05 in the main analysis are included. [1] Confidence intervals for time variables are estimated using the Brookmeyer-Crowley method. [2] Two-sided p-value obtained from unstratified log-rank test. [3] Hazard ratio and associated p-value are estimated using the unstratified Cox Proportional Hazards model (Firth correction as applicable) with treatment arm as the only covariate. [4] p-value of the interaction test based on a Cox Proportional Hazards model (Firth correction as applicable) with treatment, subgroup, and treatment x subgroup interaction included as covariates in the model.

Time to First Treatment Emergent Adverse Event by System Organ Class (SOC) and Preferred Term (PT) by Gender -
Lenalidomide and Anti-CD38 Refractory Subpopulation

System Organ Class: Eye disorders
Preferred Term: Eye irritation

Subgroup		Belamaf 2.5/1.9 mg/kg + POM/DEX (N=28)	POM + BOR/DEX (N=33)
Female	Number of subjects in subgroup, n*(%)	12 (43%)	16 (48%)
	Number of Subjects		
	Event	3 (25%)	0
	Censored	9 (75%)	16 (100%)

Note: n* is used as denominator for percentage calculation. Subjects are censored at the earliest date out of the following: Treatment end date + 70 days, new anti-cancer therapy date, or last contact date. SOCs (PTs) that have a p-value <0.05 in the main analysis are included. [1] Confidence intervals for time variables are estimated using the Brookmeyer-Crowley method. [2] Two-sided p-value obtained from unstratified log-rank test. [3] Hazard ratio and associated p-value are estimated using the unstratified Cox Proportional Hazards model (Firth correction as applicable) with treatment arm as the only covariate. [4] p-value of the interaction test based on a Cox Proportional Hazards model (Firth correction as applicable) with treatment, applicable subgroup, and treatment x subgroup interaction included as covariates in the model.
Note: Subgroup analysis was not performed because the subgroup analysis rules were not met.

Time to First Treatment Emergent Adverse Event by System Organ Class (SOC) and Preferred Term (PT) by Prior Lines of Therapy - Lenalidomide and Anti-CD38 Refractory Subpopulation

System Organ Class: Eye disorders
Preferred Term: Foreign body sensation in eyes

Subgroup		Belamaf 2.5/1.9 mg/kg + POM/DEX (N=28)	POM + BOR/DEX (N=33)
1	Number of subjects in subgroup, n*(%)	7 (25%)	6 (18%)
	Number of Subjects		
	Event	2 (29%)	0
	Censored	5 (71%)	6 (100%)

Note: The percentage for n* is calculated by taking N as denominator. For all subsequent rows, n* is used as denominator for percentage calculation. Subjects are censored at the earliest date out of the following: Treatment end date + 70 days, new anti-cancer therapy date, or last contact date.
SOCs (PTs) that have a p-value <0.05 in the main analysis are included.
Note: Subgroup analysis was not performed because the subgroup analysis rules were not met.

Time to First Maximum Grade 3 or Higher Treatment Emergent Adverse Event by System Organ Class (SOC) - Lenalidomide and Anti-CD38 Refractory Subpopulation

System Organ Class: Musculoskeletal and connective tissue disorders

	Belamaf 2.5/1.9 mg/kg + POM/DEX (N=28)	POM + BOR/DEX (N=33)
Number of Subjects		
Event	0	4 (12%)
Censored	28 (100%)	29 (88%)
Estimates for Time Variable (Months) [1]		
1st Quartile (95% CI)	- (-, -)	24.2 (12.5, -)
Median (95% CI)	- (-, -)	- (12.5, -)
3rd Quartile (95% CI)	- (-, -)	- (24.2, -)
Log-Rank P-value [2]	0.02444	
Hazard Ratio (95% CI) [3]	0.09 (0.00, 0.82)	
P-value [3]	0.14377	

Note: Subjects are censored at the earliest date out of the following: Treatment end date + 70 days, new anti-cancer therapy date, or last contact date.
[1] Confidence intervals for time variables are estimated using the Brookmeyer-Crowley method.
[2] Two-sided p-value obtained from unstratified log-rank test.
[3] Hazard ratio and associated p-value are estimated using the unstratified Cox Proportional Hazards model (Firth correction as applicable) with treatment arm as the only covariate. A hazard ratio <1 indicates a lower risk with this treatment compared with POM+BOR/DEX.

Estimates for Time Variable (Months) [1]		
1st Quartile (95% CI)	11.3 (4.6, -)	- (30.4, -)
Median (95% CI)	- (11.3, -)	- (30.4, -)
3rd Quartile (95% CI)	- (-, -)	- (-, -)
Log-Rank P-value [2]	0.22094	
Hazard Ratio (95% CI) [3]	2.28 (0.59, 8.87)	
P-value [3]	0.23371	

Note: Subjects are censored at the earliest date out of the following: Treatment end date + 70 days, new anti-cancer therapy date, or last contact date.
[1] Confidence intervals for time variables are estimated using the Brookmeyer-Crowley method.
[2] Two-sided p-value obtained from unstratified log-rank test.
[3] Hazard ratio and associated p-value are estimated using the unstratified Cox Proportional Hazards model (Firth correction as applicable) with treatment arm as the only covariate. A hazard ratio <1 indicates a lower risk with this treatment compared with POM+BOR/DEX.

1.4.1.11 Dosisanpassungen

Table 3.0000405
Summary of Dose Reductions of GSK2857916 and Bortezomib - Lenalidomide and Anti-CD38 Refractory Subpopulation

	Belamaf 2.5/1.9 mg/kg + POM/DEX (N=28)		POM + BOR/DEX (N=33)	
Subjects with Any Reduction	11	(39%)	13	(39%)
Total Number of Dose Reductions	13		16	
Total Number of Cycles with at Least One Dose Reduction	13		16	
Number of Dose Reductions				
0	15	(54%)	19	(58%)
1	9	(32%)	10	(30%)
2	2	(7%)	3	(9%)
>=3	0		0	
Not Evaluable [1]	2	(7%)	1	(3%)
Number of Cycles with a Dose Reduction				
0	15	(54%)	19	(58%)
1	9	(32%)	10	(30%)
2	2	(7%)	3	(9%)
>=3	0		0	
Not Evaluable [1]	2	(7%)	1	(3%)

[1] Not evaluable means the subject did not receive any drug in any succeeding time period after the first dose.
[2] Subjects may be counted multiple times in the same 'reason' row if the subject had multiple reductions for the same reason.
[3] Denominators are calculated as the number of subjects with a dose record at the planned visit (including records where no dose was administered). Only planned visits where at least one reduction occurred in either treatment arm is presented.
Note: Protocol-mandated reduction (e.g., reduction of belantamab mafodotin at Cycle 2 Day 1) will not be counted as reduction. Reductions reflect a reduction in dose or frequency.
/mnt/code/prod/tfls/t_s_dosred_gsk_bor_2ref.sas 01OCT2025 09:52

Table 3.0000405
Summary of Dose Reductions of GSK2857916 and Bortezomib - Lenalidomide and Anti-CD38 Refractory Subpopulation

	Belamaf 2.5/1.9 mg/kg + POM/DEX (N=28)		POM + BOR/DEX (N=33)	
Reasons for Reduction [2]

>=3	11 (39%)
Number of Cycles with a Dose Delay	
0	7 (25%)
1	2 (7%)
2	3 (11%)
>=3	16 (57%)

[1] A single dose delay will be reported when consecutive planned dosing dates
are missed/skipped/no dose is administered when planned.
[2] Duration of delay is defined as period from the expected start date of dose to subsequent
actual dosing date following dose delay. Duration of delay will be missing if dosing did not resume
prior to data cut off, i.e., if the delay was ongoing or subject subsequently discontinued treatment.
[3] Subjects may be counted multiple times in the same 'reason' row if the subject had multiple
delays for the same reason. Consecutive dose delays are only considered as a single delay
but the reasons for each of these are summarised.
Note: Delays where no dose was administered are included.

Population: Safety - Global Cohort (Len. & anti-CD38 ref.) **Data as of 07JUL2025**

Figure 3.0000805

Graph of Kaplan Meier Curves of Time to First Treatment Emergent Serious Adverse Event by System Organ Class (SOC) and Preferred Term (PT) - Lenalidomide and Anti-CD38 Refractory Subpopulation

System Organ Class: Infections and infestations
Preferred Term: COVID-19

Note: Subjects are censored at the earliest date out of the following: Treatment end date + 70 days, new anti-cancer therapy date, or last contact date.
/mnt/code/prod/tfls/f_s_aette_ser_socpt_2ref.sas 14OCT2025 13:46

Protocol: 207499
