[a] Restarted cycles occur for dose interruptions lasting more than 7 days but less than 14 (due to AEs) or 21 (due to logisitical difficulties) days
[b] Relative treatment duration is the actual duration divided by intended duration
[c]Cumulative dose is the sum of (duration of each infusion)x(dose of each infusion)
[d]Percent of intended dose is the cumulative dose divided by the planned intended cumulative dose
[e] Dose Interruption reasons may not be mutually exclusive (except if a subject indicates 'none')
All exposure records with the start date before the data-cut off were included.

Full analysis set includes all randomized subjects analyzed according to their randomized treatment assignment, regardless of the treatment received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
[a] Months are calculated as days from randomization to death or last observation on study in absence of death, divided by 30.5.
[b] Months are calculated as days from randomization to relapse/death or last disease assessment date in absence of relapse/death, divided by 30.5. Subjects who fail to achieve a CR following treatment with investigational product or who died before the disease assessment at the end of treatment will be considered treatment failures and assigned an EFS duration of 1, divided by 30.5.
Data cut-off date: 04JAN2016

Anhang 4-G2.7.1: Dauer bis zur Verschlechterung des EORTC-QLQ-C30 (Symptomatik)

Table 14-4.2.707. Time to Deterioration - Fatigue from Symptom Subscales of EORTC QLQ-C30 (EORTC QLQ-C30 Analysis Set)

	SOC Chemotherapy (N=95)	Blinatumomab (N=247)	Treatment Difference
Subject status			
Number of subjects	94	242	
Events - n (%)	69 (73.4)	139 (57.4)	
Censored - n (%)	25 (26.6)	103 (42.6)	
Stratified log-rank test[a]			
Normal score[b]			-23.72
p-value			<0.001
Unstratified log-rank test			
Normal score[b]			-24.36
p-value			<0.001
Time to event (KM) (months)[c]			
Median	0.3	1.0	
95% CI (median)	(0.3, 0.5)	(0.5, 1.5)	
Q1, Q3	0.3, 1.2	0.3, NE	
Min, Max	0.2, 1.6	0.3, 6.5	

Page 1 of 2

The EORTC QLQ-C30 Analysis Set will include all randomized subjects with a non-missing baseline and at least 1 non-missing post-baseline result of any EORTC QLQ-C30 scales/item
KM = Kaplan-Meier. CI=Confidence Interval. NE=not estimable
[a]Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no)
[b]A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time
[c]Months are calculated as days from randomization date to event/censor date, divided by 30.5
[d]Time to censoring measures follow-up time by reversing the status indicator for censored and events
[e]The hazard and hazard ratio estimates are obtained from the Cox Proportional Hazard Model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy

[a]Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no)
[b]A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time
[c]Months are calculated as days from randomization date to event/censor date, divided by 30.5
[d]Time to censoring measures follow-up time by reversing the status indicator for censored and events
[e]The hazard and hazard ratio estimates are obtained from the Cox Proportional Hazard Model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy

The ALLSS Analysis Set will include all randomized subjects with a non-missing baseline and at least 1 non-missing post-baseline ALLSS total score.
KM = Kaplan-Meier. CI=Confidence Interval. NE=not estimable
[a]Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no)
[b]A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time
[c]Months are calculated as days from randomization date to event/censor date, divided by 30.5
[d]Time to censoring measures follow-up time by reversing the status indicator for censored and events
[e]The hazard and hazard ratio estimates are obtained from the Cox Proportional Hazard Model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy

Anhang 4-G2.8: Dauer bis zur Verschlechterung des EORTC-QLQ-C30 (gesundheitsbezogene Lebensqualität)

Table 14-4.2.701. Time to Deterioration - Global Health Status or QoL of EORTC QLQ-C30
(EORTC QLQ-C30 Analysis Set)

	SOC Chemotherapy (N=95)	Blinatumomab (N=247)	Treatment Difference
Subject status			
Number of subjects	95	240	
Events - n (%)	50 (52.6)	99 (41.3)	
Censored - n (%)	45 (47.4)	141 (58.8)	
Stratified log-rank test[a]			
Normal score[b]			-14.53
p-value			0.003
Unstratified log-rank test			
Normal score[b]			-15.49
p-value			0.001
Time to event (KM) (months)[c]			
Median	1.0	8.1	
95% CI (median)	(0.5, 1.8)	(2.8, NE)	
Q1, Q3	0.3, NE	0.5, NE	
Min, Max	0.2, 2.5	0.3, 8.1	

Page 1 of 2

The EORTC QLQ-C30 Analysis Set will include all randomized subjects with a non-missing baseline and at least 1 non-missing post-baseline result of any EORTC QLQ-C30 scales/item
KM = Kaplan-Meier. CI=Confidence Interval. NE=not estimable
[a]Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no)
[b]A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time
[c]Months are calculated as days from randomization date to event/censor date, divided by 30.5
[d]Time to censoring measures follow-up time by reversing the status indicator for censored and events
[e]The hazard and hazard ratio estimates are obtained from the Cox Proportional Hazard Model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy

Min, Max	0.0, 1.5	0.0, 3.6	

Page 1 of 2

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from treatment start date to event date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.

Min, Max	0.0, 2.8	0.0, 8.7	

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of serious treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from treatment start date to event date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of severe treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from treatment start date to event date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Grading categories determined using CTCAE version 4.03.

Stratified log-rank test[c]			
Normal score[b]			-24.47
p-value			<0.0001

Page 9 of 24

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of treatment emergent adverse event of interest.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from treatment start date to event date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.

N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of treatment emergent adverse event of interest.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from treatment start date to event date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of serious treatment emergent adverse event of interest.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from treatment start date to event date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.

[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from treatment start date to event date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Grading categories determined using CTCAE version 4.03.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from randomization date to event/censor date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 18.1.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from randomization date to event/censor date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 18.1.

Page 30 of 180

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from randomization date to event/censor date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 18.1.

Table 14-6.1.12. Time to First Onset of Any Treatment-emergent Adverse Event by System Organ Class and Preferred Term (Safety Analysis Set)

	SOC Chemotherapy (N=109)	Blinatumomab (N=267)	Treatment Difference
PT: Oedema peripheral			
Subject status			
Number of subjects	109	267	
Events - n (%)[a]	16 (14.7)	39 (14.6)	
Unstratified log-rank test			
Normal score[b]			-1.89
p-value			0.5559
Stratified log-rank test[c]			
Normal score[b]			-1.88
p-value			0.5550

Page 43 of 180

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from randomization date to event/censor date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 18.1.

p-value			0.2334

Page 56 of 180

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from randomization date to event/censor date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 18.1.

Table 14-6.1.12. Time to First Onset of Any Treatment-emergent Adverse Event by System Organ Class and Preferred Term (Safety Analysis Set)

	SOC Chemotherapy (N=109)	Blinatumomab (N=267)	Treatment Difference
PT: Pneumonia			
Subject status			
Number of subjects	109	267	
Events - n (%)[a]	16 (14.7)	16 (6.0)	
Unstratified log-rank test			
Normal score[b]			-9.20
p-value			<0.0001
Stratified log-rank test[c]			
Normal score[b]			-9.15
p-value			<0.0001

Page 69 of 180

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from randomization date to event/censor date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 18.1.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from randomization date to event/censor date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 18.1.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from randomization date to event/censor date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 18.1.

p-value			0.0008

Page 108 of 180

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from randomization date to event/censor date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 18.1.

[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from randomization date to event/censor date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 18.1.

[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from randomization date to event/censor date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 18.1.

[a] Events are first onset of treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from randomization date to event/censor date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 18.1.

Anhang 4-G2.9.6: Sicherheit: SUE nach SOC, PT

Table 14-6.1.13. Time to First Onset of Serious Treatment-emergent Adverse Event by System Organ Class and Preferred Term (Safety Analysis Set)

	SOC Chemotherapy (N=109)	Blinatumomab (N=267)	Treatment Difference
SOC: Blood and lymphatic system disorders			
Subject status			
Number of subjects	109	267	
Events - n (%)[a]	17 (15.6)	36 (13.5)	
Unstratified log-rank test			
Normal score[b]			-5.69
p-value			0.0505
Stratified log-rank test[c]			
Normal score[b]			-5.92
p-value			0.0398

Page 1 of 24

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of serious treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from randomization date to event/censor date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 18.1.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of serious treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from randomization date to event/censor date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 18.1.

Anhang 4-G2.9.7: Sicherheit: Schwere UE nach SOC, PT

Table 14-6.1.14. Time to First Onset of Severe (Grade ≥ 3) Treatment-emergent Adverse Event by System Organ Class and Preferred Term (Safety Analysis Set)

	SOC Chemotherapy (N=109)	Blinatumomab (N=267)	Treatment Difference
SOC: Blood and lymphatic system disorders			
Subject status			
Number of subjects	109	267	
Events - n (%)[a]	75 (68.8)	154 (57.7)	
Unstratified log-rank test			
Normal score[b]			-22.72
p-value			0.0002
Stratified log-rank test[c]			
Normal score[b]			-21.52
p-value			0.0004

Page 1 of 56

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of severe treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from randomization date to event/censor date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 18.1. Grading categories determined using CTCAE version 4.03.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of severe treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from randomization date to event/censor date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 18.1. Grading categories determined using CTCAE version 4.03.

[a] Events are first onset of severe treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from randomization date to event/censor date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 18.1. Grading categories determined using CTCAE version 4.03.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of severe treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from randomization date to event/censor date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 18.1. Grading categories determined using CTCAE version 4.03.

Page 1 of 3

Full analysis set includes all randomized subjects analyzed according to their randomized treatment assignment, regardless of the treatment received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
Overall Survival (OS) is calculated from time of randomization until death due to any cause.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Full analysis set includes all randomized subjects analyzed according to their randomized treatment assignment, regardless of the treatment received.
N = Number of subjects in analysis set. n = Number of subjects with observed data. CI = Confidence interval. NE = Not estimable.
[a] The odds ratio obtained from a logistic regression model with logit link and risk ratio obtained from generalized binomial model with log link. An odds ratio or risk ratio < 1.0 indicates a lower event rate/ risk for Blinatumomab relative to SOC Chemotherapy.
[b] p-value is from the test of the interaction term in an unstratified logistic regression model with terms for the covariates and treatment group.
[c] Number of subjects in the full analysis set with at least one evaluable post-baseline disease assessment.
In cases with zero events, the table presents OR, RR, and ARR, including 95% confidence intervals and p-values, with zero-cell correction.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Full analysis set includes all randomized subjects analyzed according to their randomized treatment assignment, regardless of the treatment received.
N = Number of subjects in analysis set. n = Number of subjects with observed data. CI = Confidence interval. NE = Not estimable.
[a] The odds ratio obtained from a logistic regression model with logit link and risk ratio obtained from generalized binomial model with log link. An odds ratio or risk ratio < 1.0 indicates a lower event rate/ risk for Blinatumomab relative to SOC Chemotherapy.
[b] p-value is from the test of the interaction term in an unstratified logistic regression model with terms for the covariates and treatment group.
[c] Number of subjects in the full analysis set with at least one evaluable post-baseline disease assessment.
In cases with zero events, the table presents OR, RR, and ARR, including 95% confidence intervals and p-values, with zero-cell correction.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

EORTC QLQ-C30 analysis set will include all randomized subjects with a non-missing baseline and at least 1 non-missing post-baseline result of any EORTC QLQ-C30 scales/item.
N = Number of subjects in analysis set. CI = Confidence interval. EORTC QLQ = European organization for research and treatment of cancer quality of life questionnaire. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.
Data cut-off date: 04JAN2016

EORTC QLQ-C30 analysis set will include all randomized subjects with a non-missing baseline and at least 1 non-missing post-baseline result of any EORTC QLQ-C30 scales/item.
N = Number of subjects in analysis set. CI = Confidence interval. EORTC QLQ = European organization for research and treatment of cancer quality of life questionnaire. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

EORTC QLQ-C30 analysis set will include all randomized subjects with a non-missing baseline and at least 1 non-missing post-baseline result of any EORTC QLQ-C30 scales/item.
N = Number of subjects in analysis set. CI = Confidence interval. EORTC QLQ = European organization for research and treatment of cancer quality of life questionnaire. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

EORTC QLQ-C30 analysis set will include all randomized subjects with a non-missing baseline and at least 1 non-missing post-baseline result of any EORTC QLQ-C30 scales/item.
N = Number of subjects in analysis set. CI = Confidence interval. EORTC QLQ = European organization for research and treatment of cancer quality of life questionnaire. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Anhang 4-G3.5.2: Subgruppenanalyse zu ALLSS-Gesamtscore (Subgruppenanalysen)

Table 14-4.4.1. Subgroup Analysis of Time to First Deterioration of at least 7.2 points in Change from Baseline for ALLSS Sum Score (ALLSS Analysis Set)

	SOC Chemotherapy (N =86)		Blinatumomab (N =223)				
	Events/ Subjects (%)	Time to event Median (95% CI)	Events/ Subjects (%)	Time to event Median (95% CI)	Hazard Ratio (95% CI)	p-value[a]	Interaction p-value[b]
Age group 1							0.4489
<35 years	21/37 (56.8)	1.21 (0.49, 2.03)	37/107 (34.6)	8.13 (1.54, NE)	0.42 (0.25, 0.73)	0.0014	
≥35 years	30/49 (61.2)	1.05 (0.52, 1.48)	56/115 (48.7)	2.00 (1.41, 4.59)	0.55 (0.35, 0.87)	0.0074	
Age group 2							0.1006
<35 years	21/37 (56.8)	1.21 (0.49, 2.03)	37/107 (34.6)	8.13 (1.54, NE)	0.42 (0.25, 0.73)	0.0014	
35 - 54 years	13/20 (65.0)	1.05 (0.46, 1.48)	33/66 (50.0)	1.44 (0.95, NE)	0.53 (0.28, 1.03)	0.0433	
55 - 64 years	9/20 (45.0)	1.15 (0.46, NE)	14/23 (60.9)	2.00 (0.49, 3.25)	1.02 (0.42, 2.45)	0.9666	
≥65 years	8/9 (88.9)	0.95 (0.26, 1.48)	9/26 (34.6)	NE (1.41, NE)	0.24 (0.09, 0.65)	0.0024	

Page 1 of 4

ALLSS analysis set will include all randomized subjects with a non-missing baseline and at least 1 non-missing post-baseline ALLSS total score.
N = Number of subjects in analysis set. CI = Confidence interval. ALLSS = Acute lymphoblastic leukemia symptom scale. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

EORTC QLQ-C30 analysis set will include all randomized subjects with a non-missing baseline and at least 1 non-missing post-baseline result of any EORTC QLQ-C30 scales/item.
N = Number of subjects in analysis set. CI = Confidence interval. EORTC QLQ = European organization for research and treatment of cancer quality of life questionnaire. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.
Data cut-off date: 04JAN2016

[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Grading categories determined using CTCAE version 4.03.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

≥35 years	36/59 (61.0)	0.66 (0.43, 1.51)	50/144 (34.7)	7.25 (5.05, NE)	0.30 (0.19, 0.47)	<0.0001	
Age group 2							0.6259
<35 years	21/50 (42.0)	2.00 (0.62, NE)	41/124 (33.1)	6.07 (4.36, NE)	0.40 (0.23, 0.70)	0.0010	
35 - 54 years	14/25 (56.0)	0.66 (0.36, NE)	25/77 (32.5)	7.25 (2.75, NE)	0.25 (0.13, 0.52)	<0.0001	
55 - 64 years	14/22 (63.6)	0.67 (0.30, NE)	13/33 (39.4)	5.80 (1.84, NE)	0.31 (0.13, 0.71)	0.0037	
≥65 years	8/12 (66.7)	0.62 (0.26, NE)	12/33 (36.4)	6.10 (1.48, NE)	0.40 (0.16, 1.02)	0.0465	

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Grading categories determined using CTCAE version 4.03.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 18.1.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 18.1.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 18.1.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Page 48 of 195

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 18.1.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.
Data cut-off date: 04JAN2016

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 18.1.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 18.1.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 18.1.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Overall	2/109 (1.8)	NE (NE, NE)	13/267 (4.9)	NE (NE, NE)	1.56 (0.34, 7.26)	0.5668	

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 18.1.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 18.1.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 18.1.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Page 130 of 195

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 18.1.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.
Data cut-off date: 04JAN2016

	SOC Chemotherapy (N = 109)		Blinatumomab (N = 267)				
	Events/ Subjects (%)	Time to event Median (95% CI)	Events/ Subjects (%)	Time to event Median (95% CI)	Hazard Ratio (95% CI)	p-value[a]	Interaction p-value[b]
PT: Hypophosphataemia							
Overall	6/109 (5.5)	NE (NE, NE)	13/267 (4.9)	NE (NE, NE)	0.74 (0.28, 1.99)	0.5478	

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 18.1.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.
Data cut-off date: 04JAN2016

Table 14-6.2.11. Subgroup Analysis of Time to First Onset of Any Treatment-emergent Adverse Event by System Organ Class and Preferred Term (Safety Analysis Set)

	SOC Chemotherapy (N = 109)		Blinatumomab (N = 267)				
	Events/ Subjects (%)	Time to event Median (95% CI)	Events/ Subjects (%)	Time to event Median (95% CI)	Hazard Ratio (95% CI)	p-value[a]	Interaction p-value[b]
PT: Musculoskeletal pain							
Overall	3/109 (2.8)	NE (NE, NE)	11/267 (4.1)	NE (13.18, NE)	0.92 (0.24, 3.50)	0.9028	

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 18.1.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

	Events/ Subjects (%)	Time to event Median (95% CI)	Events/ Subjects (%)	Time to event Median (95% CI)	Hazard Ratio (95% CI)	p-value[a]	Interaction p-value[b]
PT: Cough							
Overall	6/109 (5.5)	NE (NE, NE)	39/267 (14.6)	NE (NE, NE)	1.74 (0.72, 4.17)	0.2119	

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 18.1.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 18.1.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.
Data cut-off date: 04JAN2016
