≥65 years	4/12 (33.3)	NE (0.20, NE)	5/33 (15.2)	NE (4.59, NE)	0.07 (0.01, 0.67)	0.0026	

Page 1 of 18

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 18.1.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Page 5 of 18

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 18.1.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Table 14-6.2.12. Subgroup Analysis of Time to First Onset of Serious Treatment-emergent Adverse Event by System Organ Class and Preferred Term (Safety Analysis Set)

	SOC Chemotherapy (N = 109)		Blinatumomab (N = 267)				
	Events/ Subjects (%)	Time to event Median (95% CI)	Events/ Subjects (%)	Time to event Median (95% CI)	Hazard Ratio (95% CI)	p-value[a]	Interaction p-value[b]
SOC: Nervous system disorders							
Overall	4/109 (3.7)	NE (NE, NE)	19/267 (7.1)	NE (NE, NE)	1.41 (0.47, 4.20)	0.5395	

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 18.1.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.
Data cut-off date: 04JAN2016

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 18.1. Grading categories determined using CTCAE version 4.03.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 18.1. Grading categories determined using CTCAE version 4.03.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.
Data cut-off date: 04JAN2016

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 18.1. Grading categories determined using CTCAE version 4.03.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.
Data cut-off date: 04JAN2016

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 18.1. Grading categories determined using CTCAE version 4.03.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

	Events/ Subjects (%)	Time to event Median (95% CI)	Events/ Subjects (%)	Time to event Median (95% CI)	Hazard Ratio (95% CI)	p-value[a]	Interaction p-value[b]
Central laboratory baseline bone marrow blasts							0.9880
<50%	4/27 (14.8)	NE (NE, NE)	0/73 (0.0)	NE (NE, NE)	NE (NE, NE)	0.0003	
≥50%	7/77 (9.1)	NE (NE, NE)	8/168 (4.8)	NE (NE, NE)	0.45 (0.16, 1.26)	0.1211	

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 18.1. Grading categories determined using CTCAE version 4.03.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.
Data cut-off date: 04JAN2016

Table 14-8.2.2. Summary of Completion Rate for ALLSS sum score (Full Analysis Set)

	SOC Chemotherapy (N=134)		Blinatumomab (N=271)	
ALLSS sum score	n/N1	Completion Rate	n/N1	Completion Rate
Baseline	98/112	87.5	231/267	86.5
Cycle 1 Day 8	77/106	72.6	228/258	88.4
Cycle 1 Day 15	72/102	70.6	221/243	90.9
Cycle 1 Day 29	54/90	60.0	160/218	73.4
Cycle 2 Day 1	26/31	83.9	141/152	92.8
Cycle 2 Day 15	21/27	77.8	119/142	83.8
Cycle 2 Day 29	15/23	65.2	114/138	82.6
Cycle 3 Day 1	7/7	100.0	78/88	88.6
Cycle 3 Day 15	3/3	100.0	79/85	92.9
Cycle 3 Day 29	3/5	60.0	69/81	85.2
Cycle 4 Day 1	2/2	100.0	61/65	93.8
Cycle 4 Day 15	3/3	100.0	59/63	93.7
Cycle 4 Day 29	1/1	100.0	55/61	90.2
Cycle 5 Day 1	0/0	-	44/48	91.7
Cycle 5 Day 15	0/0	-	42/48	87.5
Cycle 5 Day 29	0/0	-	41/45	91.1
Safety Follow Up	43/72	59.7	99/170	58.2

Page 1 of 1

Full analysis set includes all randomized subjects analyzed according to their randomized treatment assignment, regardless of the treatment received.
N = Number of subjects in the analysis set. n = Number of subjects who completed the forms.
N1 = Number of subjects expected to complete the forms. ALLSS= Acute lymphoblastic leukemia symptom scale.
The completion rate at each assessment time is defined as the number of received forms divided by the number of expected forms at each assessment time.
Data cut-off date: 14MAR2017

Anhang 4-G4.2: Analysen zum Datenschnitt 14. März 2017

Table 14-4.5.1. Overall Survival
(Full Analysis Set)

	SOC Chemotherapy (N=134)	Blinatumomab (N=271)	Treatment Difference
Subject status			
Events - n (%)	90 (67.2)	184 (67.9)	
Deaths from any cause	90 (67.2)	184 (67.9)	
Censored - n (%)	44 (32.8)	87 (32.1)	
Alive at last follow-up	0 (0.0)	0 (0.0)	
Consent withdrawn	13 (9.7)	9 (3.3)	
Lost to follow-up	0 (0.0)	1 (0.4)	
Decision by sponsor	31 (23.1)	77 (28.4)	
Stratified log-rank test[a]			
Normal score[b]			-14.21
p-value			0.052
Unstratified log-rank test			
Normal score[b]			-13.84
p-value			0.061
Time to event (KM) (months)[c]			
Median	4.0	7.7	
95% CI (median)	(2.9, 5.5)	(5.6, 9.6)	
Q1, Q3	1.9, 20.2	2.1, 17.1	
Min, Max	0.1, 20.2	0.1, 23.4	

Page 1 of 2

KM = Kaplan-Meier. CI=Confidence Interval. NE=not estimable
[a]Stratification factors are: age (<35 vs. ≥35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no)
[b]A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time
[c]Months are calculated as days from randomization date to event/censor date, divided by 30.5
[d]Time to censoring measures follow-up time by reversing the status indicator for censored and events
[e]The hazard and hazard ratio estimates are obtained from the Cox Proportional Hazard Model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy

Full analysis set includes all randomized subjects analyzed according to their randomized treatment assignment, regardless of the treatment received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data. CI = Confidence interval.
[a] Stratification factors are: age (<35 vs.≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no)
[b] The odds ratio obtained from a logistic regression model with logit link and risk ratio obtained from generalized binomial model with log link. An odds ratio or risk ratio < 1.0 indicates a lower event rate/ risk for Blinatumomab relative to SOC Chemotherapy.
[c] Number of subjects in the full analysis set with at least one evaluable post-baseline disease assessment.
[d] Stratified risk ratio obtained from generalized poisson model with log link.
Data cut-off date: 14MAR2017

ALLSS analysis set will include all randomized subjects with a non-missing baseline and at least 1 non-missing post-baseline ALLSS total score.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable. ALLSS = Acute lymphoblastic leukemia symptom scale.
[a] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[b] Stratification factors are: age (<35 vs.≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[c] Months are calculated as days from treatment start date to event/censor date, divided by 30.5.
[d] Time to censoring measures follow-up time by reversing the status indicator for censored and events.
[e] The hazard and hazard ratio estimates are obtained from the stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.

ALLSS analysis set will include all randomized subjects with a non-missing baseline and at least 1 non-missing post-baseline ALLSS total score.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable. ALLSS = Acute lymphoblastic leukemia symptom scale.
[a] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[b] Stratification factors are: age (<35 vs.≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[c] Months are calculated as days from treatment start date to event/censor date, divided by 30.5.
[d] Time to censoring measures follow-up time by reversing the status indicator for censored and events.
[e] The hazard and hazard ratio estimates are obtained from the stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.

ALLSS analysis set will include all randomized subjects with a non-missing baseline and at least 1 non-missing post-baseline ALLSS total score.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable. ALLSS = Acute lymphoblastic leukemia symptom scale.
[a] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[b] Stratification factors are: age (<35 vs.≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[c] Months are calculated as days from treatment start date to event/censor date, divided by 30.5.
[d] Time to censoring measures follow-up time by reversing the status indicator for censored and events.
[e] The hazard and hazard ratio estimates are obtained from the stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.

EORTC QLQ-C30 analysis set will include all randomized subjects with a non-missing baseline and at least 1 non-missing post-baseline result of any EORTC QLQ-C30 scales/item.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable. EORTC QLQ = European organization for research and treatment of cancer quality of life questionnaire.
[a] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[b] Stratification factors are: age (<35 vs.≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[c] Months are calculated as days from treatment start date to event/censor date, divided by 30.5.
[d] Time to censoring measures follow-up time by reversing the status indicator for censored and events.
[e] The hazard and hazard ratio estimates are obtained from the stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.

EORTC QLQ-C30 analysis set will include all randomized subjects with a non-missing baseline and at least 1 non-missing post-baseline result of any EORTC QLQ-C30 scales/item.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable. EORTC QLQ = European organization for research and treatment of cancer quality of life questionnaire.
[a] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[b] Stratification factors are: age (<35 vs.≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[c] Months are calculated as days from treatment start date to event/censor date, divided by 30.5.
[d] Time to censoring measures follow-up time by reversing the status indicator for censored and events.
[e] The hazard and hazard ratio estimates are obtained from the stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.

KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable. EORTC QLQ = European organization for research and treatment of cancer quality of life questionnaire.
[a] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[b] Stratification factors are: age (<35 vs.≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[c] Months are calculated as days from treatment start date to event/censor date, divided by 30.5.
[d] Time to censoring measures follow-up time by reversing the status indicator for censored and events.
[e] The hazard and hazard ratio estimates are obtained from the stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.

[a] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[b] Stratification factors are: age (<35 vs.≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[c] Months are calculated as days from treatment start date to event/censor date, divided by 30.5.
[d] Time to censoring measures follow-up time by reversing the status indicator for censored and events.
[e] The hazard and hazard ratio estimates are obtained from the stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of serious treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from treatment start date to event date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of treatment emergent adverse event of interest.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from treatment start date to event date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of treatment emergent adverse event of interest.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from treatment start date to event date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of serious treatment emergent adverse event of interest.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from treatment start date to event date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of serious treatment emergent adverse event of interest.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from treatment start date to event date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of severe treatment emergent adverse event of interest.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from treatment start date to event date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Grading categories determined using CTCAE version 4.03.

Table 14-6.1.12. Time to First Onset of Any Treatment-emergent Adverse Event by System Organ Class and Preferred Term (Safety Analysis Set)

	SOC Chemotherapy (N=109)	Blinatumomab (N=267)	Treatment Difference
PT: Thrombocytopenia			
Subject status			
Number of subjects	109	267	
Events - n (%)[a]	32 (29.4)	48 (18.0)	
Unstratified log-rank test			
Normal score[b]			-11.22
p-value			0.0035
Stratified log-rank test[c]			
Normal score[b]			-10.68
p-value			0.0059

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from treatment start date to event date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 20.0.

Table 14-6.1.12. Time to First Onset of Any Treatment-emergent Adverse Event by System Organ Class and Preferred Term (Safety Analysis Set)

	SOC Chemotherapy (N=109)	Blinatumomab (N=267)	Treatment Difference
Time to event (KM) (months)[d]			
Median	NE	NE	
95% CI (median)	(NE, NE)	(NE, NE)	
Q1, Q3	NE, NE	NE, NE	
Min, Max	0.0, 1.0	0.0, 8.7	
Unstratified hazard ratio[e]			0.52
(95% CI)			(0.27, 1.00)
p-value			0.0505
Stratified hazard ratio[c,e]			0.51
(95% CI)			(0.26, 1.00)
p-value			0.0500

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from treatment start date to event date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 20.0.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from treatment start date to event date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 20.0.

Table 14-6.1.12. Time to First Onset of Any Treatment-emergent Adverse Event by System Organ Class and Preferred Term (Safety Analysis Set)

	SOC Chemotherapy (N=109)	Blinatumomab (N=267)	Treatment Difference
Time to event (KM) (months)[d]			
Median	NE	NE	
95% CI (median)	(NE, NE)	(NE, NE)	
Q1, Q3	NE, NE	11.51, NE	
Min, Max	0.1, 1.4	0.0, 11.5	
Unstratified hazard ratio[e]			0.74
(95% CI)			(0.39, 1.41)
p-value			0.3601
Stratified hazard ratio[c,e]			0.73
(95% CI)			(0.38, 1.39)
p-value			0.3312

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from treatment start date to event date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 20.0.

Table 14-6.1.12. Time to First Onset of Any Treatment-emergent Adverse Event by System Organ Class and Preferred Term (Safety Analysis Set)

	SOC Chemotherapy (N=109)	Blinatumomab (N=267)	Treatment Difference
PT: Cytokine release syndrome			
Subject status			
Number of subjects	109	267	
Events - n (%)[a]	0 (0.0)	38 (14.2)	
Unstratified log-rank test			
Normal score[b]			11.17
p-value			<0.0001
Stratified log-rank test[c]			
Normal score[b]			10.98
p-value			<0.0001

Page 61 of 182

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from treatment start date to event date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 20.0.

Table 14-6.1.12. Time to First Onset of Any Treatment-emergent Adverse Event by System Organ Class and Preferred Term (Safety Analysis Set)

	SOC Chemotherapy (N=109)	Blinatumomab (N=267)	Treatment Difference
Time to event (KM) (months)[d]			
Median	NE	NE	
95% CI (median)	(NE, NE)	(NE, NE)	
Q1, Q3	NE, NE	NE, NE	
Min, Max	0.3, 0.6	0.1, 4.7	
Unstratified hazard ratio[e]			0.47
(95% CI)			(0.20, 1.11)
p-value			0.0837
Stratified hazard ratio[c,e]			0.46
(95% CI)			(0.19, 1.11)
p-value			0.0827

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from treatment start date to event date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 20.0.

Table 14-6.1.12. Time to First Onset of Any Treatment-emergent Adverse Event by System Organ Class and Preferred Term (Safety Analysis Set)

	SOC Chemotherapy (N=109)	Blinatumomab (N=267)	Treatment Difference
PT: Platelet count decreased			
Subject status			
Number of subjects	109	267	
Events - n (%)[a]	13 (11.9)	18 (6.7)	
Unstratified log-rank test			
Normal score[b]			-5.47
p-value			0.0190
Stratified log-rank test[c]			
Normal score[b]			-5.24
p-value			0.0254

Page 87 of 182

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from treatment start date to event date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 20.0.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from treatment start date to event date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 20.0.

Table 14-6.1.12. Time to First Onset of Any Treatment-emergent Adverse Event by System Organ Class and Preferred Term (Safety Analysis Set)

	SOC Chemotherapy (N=109)	Blinatumomab (N=267)	Treatment Difference
PT: Hypophosphataemia			
Subject status			
Number of subjects	109	267	
Events - n (%)[a]	6 (5.5)	14 (5.2)	
Unstratified log-rank test			
Normal score[b]			-1.12
p-value			0.5478
Stratified log-rank test[c]			
Normal score[b]			-1.23
p-value			0.5096

Page 113 of 182

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from treatment start date to event date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 20.0.

Table 14-6.1.12. Time to First Onset of Any Treatment-emergent Adverse Event by System Organ Class and Preferred Term (Safety Analysis Set)

	SOC Chemotherapy (N=109)	Blinatumomab (N=267)	Treatment Difference
Time to event (KM) (months)[d]			
Median	NE	NE	
95% CI (median)	(NE, NE)	(NE, NE)	
Q1, Q3	NE, NE	NE, NE	
Min, Max	0.1, 1.6	0.0, 10.2	
Unstratified hazard ratio[e]			0.82
(95% CI)			(0.36, 1.87)
p-value			0.6321
Stratified hazard ratio[c,e]			0.86
(95% CI)			(0.37, 1.97)
p-value			0.7162

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from treatment start date to event date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 20.0.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from treatment start date to event date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 20.0.

	SOC Chemotherapy (N=109)	Blinatumomab (N=267)	Treatment Difference
Time to event (KM) (months)[d]			
Median	NE	NE	
95% CI (median)	(NE, NE)	(NE, NE)	
Q1, Q3	NE, NE	NE, NE	
Min, Max	0.1, 1.0	0.0, 16.5	
Unstratified hazard ratio[e]			0.65
(95% CI)			(0.24, 1.76)
p-value			0.3965
Stratified hazard ratio[c,e]			0.69
(95% CI)			(0.25, 1.88)
p-value			0.4675

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from treatment start date to event date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 20.0.

Stratified log-rank test[c]			
Normal score[b]			-1.96
p-value			0.3478

Page 165 of 182

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from treatment start date to event date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 20.0.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from treatment start date to event date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 20.0.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of serious treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from treatment start date to event date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 20.0.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of severe treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from treatment start date to event date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 20.0. Grading categories determined using CTCAE version 4.03.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of severe treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from treatment start date to event date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 20.0. Grading categories determined using CTCAE version 4.03.

[a] Events are first onset of severe treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from treatment start date to event date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 20.0. Grading categories determined using CTCAE version 4.03.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. n = Number of subjects with observed data.
KM = Kaplan-Meier. CI = Confidence interval. NE = Not estimable.
[a] Events are first onset of severe treatment emergent adverse event.
[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from treatment start date to event date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.
Adverse events coded using MedDRA version 20.0. Grading categories determined using CTCAE version 4.03.

[b] A normal score < 0 indicates fewer than expected events for Blinatumomab relative to SOC Chemotherapy and therefore a longer survival time.
[c] Stratification factors are: age (<35 vs. ≥ 35), prior salvage therapy (yes vs. no), and prior alloHSCT (yes vs. no).
[d] Months are calculated as days from treatment start date to event date, divided by 30.5.
[e] The hazard and hazard ratio estimates are obtained from the unstratified and stratified Cox proportional hazard model. A hazard ratio < 1.0 indicates a lower average event rate and a longer survival for Blinatumomab relative to SOC Chemotherapy.

≥65 years	8/9 (88.9)	0.95 (0.26, 1.48)	9/26 (34.6)	NE (1.41, NE)	0.24 (0.09, 0.65)	0.0024	

ALLSS analysis set will include all randomized subjects with a non-missing baseline and at least 1 non-missing post-baseline ALLSS total score.
N = Number of subjects in analysis set. CI = Confidence interval. ALLSS = Acute lymphoblastic leukemia symptom scale. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

EORTC QLQ-C30 analysis set will include all randomized subjects with a non-missing baseline and at least 1 non-missing post-baseline result of any EORTC QLQ-C30 scales/item.
N = Number of subjects in analysis set. CI = Confidence interval. EORTC QLQ = European organization for research and treatment of cancer quality of life questionnaire. NE = Not estimable. QoL = Quality of Life.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

EORTC QLQ-C30 analysis set will include all randomized subjects with a non-missing baseline and at least 1 non-missing post-baseline result of any EORTC QLQ-C30 scales/item.
N = Number of subjects in analysis set. CI = Confidence interval. EORTC QLQ = European organization for research and treatment of cancer quality of life questionnaire. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.
Data cut-off date: 14MAR2017

Table 14-4.4.16. Subgroup Analysis of Time to First Deterioration of at least 10 points - Financial Impact from EORTC QLQ - C30 (EORTC QLQ - C30 Analysis Set)

	SOC Chemotherapy (N = 95)		Blinatumomab (N = 247)				
	Events/ Subjects (%)	Time to event Median (95% CI)	Events/ Subjects (%)	Time to event Median (95% CI)	Hazard Ratio (95% CI)	p-value[a]	Interaction p-value[b]
Central laboratory baseline bone marrow blasts							0.7053
<50%	11/25 (44.0)	2.30 (0.49, NE)	27/65 (41.5)	17.74 (2.82, NE)	0.59 (0.29, 1.24)	0.1539	
≥50%	20/66 (30.3)	NE (1.80, NE)	43/149 (28.9)	NE (4.39, NE)	0.81 (0.48, 1.39)	0.4278	

Page 5 of 5

EORTC QLQ-C30 analysis set will include all randomized subjects with a non-missing baseline and at least 1 non-missing post-baseline result of any EORTC QLQ-C30 scales/item.
N = Number of subjects in analysis set. CI = Confidence interval. EORTC QLQ = European organization for research and treatment of cancer quality of life questionnaire. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Grading categories determined using CTCAE version 4.03.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Grading categories determined using CTCAE version 4.03.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Others	0/19 (0.0)	-	1/41 (2.4)	-	-	-	

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Grading categories determined using CTCAE version 4.03.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 20.0.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 20.0.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.
Data cut-off date: 14MAR2017

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 20.0.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Page 49 of 196

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 20.0.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 20.0.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 20.0.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 20.0.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 20.0.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 20.0.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Page 131 of 196

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 20.0.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.
Data cut-off date: 14MAR2017

Table 14-6.2.11. Subgroup Analysis of Time to First Onset of Any Treatment-emergent Adverse Event by System Organ Class and Preferred Term (Safety Analysis Set)

	SOC Chemotherapy (N = 109)		Blinatumomab (N = 267)				
	Events/ Subjects (%)	Time to event Median (95% CI)	Events/ Subjects (%)	Time to event Median (95% CI)	Hazard Ratio (95% CI)	p-value[a]	Interaction p-value[b]
PT: Musculoskeletal pain							
Overall	3/109 (2.8)	NE (NE, NE)	11/267 (4.1)	NE (NE, NE)	0.92 (0.24, 3.51)	0.9036	

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 20.0.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.
Data cut-off date: 14MAR2017

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 20.0.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 20.0.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 20.0. Grading categories determined using CTCAE version 4.03.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

55 - 64 years	1/22 (4.5)	-	0/33 (0.0)	-	-	-	
≥65 years	1/12 (8.3)	-	0/33 (0.0)	-	-	-	

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 20.0. Grading categories determined using CTCAE version 4.03.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Overall	6/109 (5.5)	NE (NE, NE)	9/267 (3.4)	NE (NE, NE)	0.37 (0.12, 1.12)	0.0682	

Safety analysis set includes all subjects who received protocol-specified therapy analyzed according to the treatment they received.
N = Number of subjects in the analysis set. CI = Confidence interval. NE = Not estimable.
[a] p-values were calculated using the unstratified log-rank test.
[b] p-value is from a test of the interaction term in an unstratified Cox model with terms for the covariate and treatment group included, subjects with a missing value of the covariate were not included in the model.
The hazard ratio estimate for all subjects was obtained from an unstratified Cox regression model.
Adverse events coded using MedDRA version 20.0. Grading categories determined using CTCAE version 4.03.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Page 1 of 22

Full analysis set includes all randomized subjects analyzed according to their randomized treatment assignment, regardless of the treatment received.
N = Number of subjects in analysis set. n = Number of subjects with observed data. CI = Confidence interval. NE = Not estimable.
[a] The odds ratio obtained from a logistic regression model with logit link and risk ratio obtained from generalized binomial model with log link. An odds ratio or risk ratio < 1.0 indicates a lower event rate/ risk for Blinatumomab relative to SOC Chemotherapy.
[b] p-value is from the test of the interaction term in an unstratified logistic regression model with terms for the covariates and treatment group.
[c] Number of subjects in the full analysis set with at least one evaluable post-baseline disease assessment.
In cases with zero events, the table presents OR, RR, and ARR, including 95% confidence intervals and p-values, with zero-cell correction.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Table 14-4.2.1. Subgroup Analysis for Complete Remission (Full Analysis Set)

Subgroup	SOC Chemotherapy (N=134)	Blinatumomab (N=271)	Treatment Difference	Interaction p-value[b]
Sex: Female	57	109		
Number of subjects assessed[c]	29	87		
Events - n (%)	8 (27.6)	42 (48.3)	20.7	
Unstratified odds ratio[a]			2.45	
(95% CI)			(0.98, 6.13)	
p-value			0.0553	
Unstratified risk ratio[a]			1.75	
(95% CI)			(0.93, 3.28)	
p-value			0.0810	
Absolute risk reduction			0.21	
(95% CI)			(0.01, 0.40)	
p-value			0.0362	

Page 8 of 22

Full analysis set includes all randomized subjects analyzed according to their randomized treatment assignment, regardless of the treatment received.
N = Number of subjects in analysis set. n = Number of subjects with observed data. CI = Confidence interval. NE = Not estimable.
[a] The odds ratio obtained from a logistic regression model with logit link and risk ratio obtained from generalized binomial model with log link. An odds ratio or risk ratio < 1.0 indicates a lower event rate/ risk for Blinatumomab relative to SOC Chemotherapy.
[b] p-value is from the test of the interaction term in an unstratified logistic regression model with terms for the covariates and treatment group.
[c] Number of subjects in the full analysis set with at least one evaluable post-baseline disease assessment.
In cases with zero events, the table presents OR, RR, and ARR, including 95% confidence intervals and p-values, with zero-cell correction.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Full analysis set includes all randomized subjects analyzed according to their randomized treatment assignment, regardless of the treatment received.
N = Number of subjects in analysis set. n = Number of subjects with observed data. CI = Confidence interval. NE = Not estimable.
[a] The odds ratio obtained from a logistic regression model with logit link and risk ratio obtained from generalized binomial model with log link. An odds ratio or risk ratio < 1.0 indicates a lower event rate/ risk for Blinatumomab relative to SOC Chemotherapy.
[b] p-value is from the test of the interaction term in an unstratified logistic regression model with terms for the covariates and treatment group.
[c] Number of subjects in the full analysis set with at least one evaluable post-baseline disease assessment.
In cases with zero events, the table presents OR, RR, and ARR, including 95% confidence intervals and p-values, with zero-cell correction.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Page 10 of 22

Full analysis set includes all randomized subjects analyzed according to their randomized treatment assignment, regardless of the treatment received.
N = Number of subjects in analysis set. n = Number of subjects with observed data. CI = Confidence interval. MRD=Minimal residual disease. NE = Not estimable.
[a] The odds ratio obtained from a logistic regression model with logit link and risk ratio obtained from generalized binomial model with log link. An odds ratio or risk ratio < 1.0 indicates a lower event rate/ risk for Blinatumomab relative to SOC Chemotherapy.
[b] p-value is from the test of the interaction term in an unstratified logistic regression model with terms for the covariates and treatment group.
[c] Number of subjects in the full analysis set with at least one evaluable post-baseline disease assessment.
In cases with zero events, the table presents OR, RR, and ARR, including 95% confidence intervals and p-values, with zero-cell correction.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Full analysis set includes all randomized subjects analyzed according to their randomized treatment assignment, regardless of the treatment received.
N = Number of subjects in analysis set. n = Number of subjects with observed data. CI = Confidence interval. MRD=Minimal residual disease. NE = Not estimable.
[a] The odds ratio obtained from a logistic regression model with logit link and risk ratio obtained from generalized binomial model with log link. An odds ratio or risk ratio < 1.0 indicates a lower event rate/ risk for Blinatumomab relative to SOC Chemotherapy.
[b] p-value is from the test of the interaction term in an unstratified logistic regression model with terms for the covariates and treatment group.
[c] Number of subjects in the full analysis set with at least one evaluable post-baseline disease assessment.
In cases with zero events, the table presents OR, RR, and ARR, including 95% confidence intervals and p-values, with zero-cell correction.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Full analysis set includes all randomized subjects analyzed according to their randomized treatment assignment, regardless of the treatment received.
N = Number of subjects in analysis set. n = Number of subjects with observed data. CI = Confidence interval. MRD = Minimal residual disease. NE = Not estimable.
[a] The odds ratio obtained from a logistic regression model with logit link and risk ratio obtained from generalized binomial model with log link. An odds ratio or risk ratio < 1.0 indicates a lower event rate/ risk for Blinatumomab relative to SOC Chemotherapy.
[b] p-value is from the test of the interaction term in an unstratified logistic regression model with terms for the covariates and treatment group.
[c] Number of subjects in the full analysis set with at least one evaluable post-baseline disease assessment.
In cases with zero events, the table presents OR, RR, and ARR, including 95% confidence intervals and p-values, with zero-cell correction.
Age group1, prior salvage therapy and prior alloHSCT are as per randomized strata.

Figure 14-6.2.13. Kaplan-Meier plot for Subgroup Analysis of Time to First Onset of Severe (Grade ≥ 3) Treatment-emergent Adverse Event by System Organ Class and Preferred Term (Safety Analysis Set)

Censor indicated by vertical bar |. CI = Confidence interval. NE = Not estimable.
Adverse events coded using MedDRA version 20.0. Grading categories determined using CTCAE version 4.03.
Data cut-off date: 14MAR2017
